

# Power Supply Unit, Primary Switched, Narrow Design MINI-PS-48-60DC/24DC/1

- Extra narrow design with widths of 22.5 mm, 45 mm, and 67.5 mm (0.886, 1.772, and 2.657 in.)
- · Global use due to a wide-range input
- A high level of operational safety in complex global networks
- Reliable startup of heavy loads due to
   POWER BOOST

The reliability of a power supply unit determines the availability of individual components in a system and whether complex systems can function safely.

The globalization of markets increases the demands placed on the power supply unit. A wide-range input and a high level of availability are required. These requirements are met by MINI POWER.

# 1. Short Description

MINI POWER is the extra narrow power supply unit, which is available in widths of 22.5 mm, 45 mm, and 67.5 mm (0.886, 1.772, and 2.657 in.).

In addition to a 24 V version with output currents of 1 A, 2 A, and 4 A, special voltages are also available with 5 V/3 A, +/-15 V/1 A, and 10 - 15 V/2 A for connection to single-phase AC networks or to two external conductors in three-phase networks with nominal voltages of 100 - 240 V AC. Two DC/DC converters convert low direct voltages into an adjustable and regulated 24 V output voltage.

With the DIN rail bus connector, the MINI-SYS-PS can be connected in parallel to supply other modules in the same system with a regulated 24 V DC voltage.

Reliable startup of heavy loads is ensured by a power reserve of up to 100% – the POWER BOOST. The high level of operational safety is also ensured in

complex global networks. MINI POWER also operates in applications where static voltage dips, transient power supply failures or phase failure are common.

Powerful capacitors ensure mains buffering of more than 20 ms at full load.

# 2. Area of Application

MINI POWER can be used globally due to the consistent provision of a wide-range input.

In this way, your entire system can be tested at any production location in the world and can be delivered to any location in the world without faulty switching of the input voltage. This reduces storage costs and logistical effort.

An international approval package including UL 60950 for IT equipment and UL 508 for industrial control equipment enables the device to be used globally.

- 5 DC OK LED
- 6 Universal latching foot for EN DIN rails

## 5. Safety Notes and Warning Instructions

#### To ensure that the device can be operated safely and all functions can be used, please read these instructions carefully.

**Installation and startup** must only be carried out by qualified personnel. The relevant country-specific

regulations (e.g., VDE, DIN) must also be observed. Before startup it is particularly important to ensure that:

- All supply lines have sufficient fuse protection and are the correct size.
- All output cables are the correct size for the maximum device output current or have separate fuse protection.
- · Sufficient convection is ensured.

# 6. Installation

#### 6.1. Mounting

The power supply unit can be snapped onto all DIN rails according to EN 60715. The device must be mounted horizontally (input terminal blocks facing downwards).

#### Installation Dimensions

To ensure sufficient convection, a minimum spacing of 5 cm (1.969 in.) to other modules is required above and below the device.

#### Mounting:

Place the module with the DIN rail guideway on the **top edge** of the DIN rail and then snap it **downwards**.

#### Removal:

Release the snap-on catch using a screwdriver and then detach the module from the **bottom edge** of the DIN rail.

#### 6.2 Connecting Cable

The device is equipped with COMBICON connectors. This reliable user-friendly connection method enables quick device connection and visible isolation of the electrical connection, if required. **Only operate connectors when the power is switched off.** 

The following cable cross sections can be connected:

	Solid	Stranded	AWG	Torque
	[mm <sup>2</sup> ]	[mm <sup>2</sup> ]		[Nm] [Ib in]
<ol> <li>Input:</li> <li>Output:</li> <li>Signal:</li> </ol>	0.2 - 2.5	0.2 - 2.5	25 - 14	0.5 - 0.6 4.4 - 5.3
Output:	0.2 - 2.5	0.2 - 2.5	25 - 14	0.5 - 0.6 4.4 - 5.3
(3) Signal:	0.2 - 2.5	0.2 - 2.5	25 - 14	0.5 - 0.6 4.4 - 5.3

7	mm	(0.28	ii
	[		
		1	

in.) For reliable and safe-to-touch

connections: Strip 7 mm (0.28 in.)
 from the connector ends.

#### 6.3. Input (1), Figure 9)

The 48 - 60 V DC connection is made using the "+" and "-" screw connections.

#### **Protecting the Primary Side**

The device must be installed according to the specifications of EN 60 950.

Device protection is not required, as an internal fuse is present.

ł

If the internal fuse is blown, this is most probably due to a device fault. In this case, the device should be checked in the factory.

#### 6.4. Output (2, Figure 9)

The 24 V DC connection is made using the "+" and "-" screw connections on the screw connection (2). The output voltage set upon delivery is 24 V DC.

The output voltage can be adjusted from 22.5 to 28.5 V DC on the potentiometer (4).

#### Protecting the Secondary Side:

The device is electronically short-circuit-proof and idling-proof. In the event of an error, the output voltage is limited to a maximum of 35 V DC.

It should be ensured that all output cables are the correct size for the maximum output current or have separate fuse protection.

The cable cross sections in the secondary circuit should be large enough to keep the voltage drops on the cables as low as possible.

#### Active Signal Output (3), Figure 10)

The 24 V DC signal is between the "DC OK" and "-" connection terminal blocks and can be loaded with 20 mA maximum. This signal output indicates that the output voltage has fallen below 21.5 V DC when "active high" changes to "low".

The DC OK signal is isolated from the power output. This ensures that a separate supply does not enter from devices connected in parallel.

The 24 V DC signal can be connected directly to a logic input for evaluation.

#### Signaling

The active DC OK switching output and the DC OK LED provide function monitoring.

	Status 1	Status 2
Green "DC OK" LED (5)	ON	OFF
Active DC OK switching output (3)	U = +24 V (with reference to "-")	U = 0 V (with reference to "-")
Meaning	Normal operation of the power supply unit U <sub>OUT</sub> > 21.5 V	U <sub>OUT</sub> ≤ 21.5 V DC • Secondary load short circuit or overload • No mains voltage or device fault

# 7. Installation

#### 7.1. Output Characteristic Curve

The device can supply a nominal output current of 1 A up to an ambient temperature of 60°C (140°F). At temperatures up to 60°C (140°F), the POWER BOOST provides a short-term output current of 1.5 A for a few minutes.

In the event of heavier loads the working point demonstrates the U/I characteristic curve shown in Figure 11.

On an overload or short circuit, the entire output current I BOOST is provided permanently at a reduced output voltage.

Once the overload or short circuit has been removed, the entire set secondary voltage is available again.

The U/I characteristic curve ensures that both heavy capacitive loads and devices with DC/DC converters can be supplied by MINI POWER in the input circuit without any problems.

Connected fuses are reliably tripped. The selectivity in your system configuration is ensured at all times.

#### 7.2. Temperature Response

The device can supply a nominal output current of 1 A up to an ambient temperature of 60°C (140°F). At temperatures up to 60°C (140°F), the POWER BOOST provides a short-term output current of 1.5 A for a few minutes.

The output power must be decreased by 2.5% per Kelvin temperature increase for ambient temperatures above  $+60^{\circ}C$  (140°F). At ambient temperatures above  $+70^{\circ}C$  ( $+158^{\circ}F$ ) or in the event of a thermal overload, the device reduces the output power to protect itself and returns to normal operation once it has cooled down.

#### 7.3. Parallel Operation

Devices of the same type can be connected in parallel to increase both redundancy and power. The default setting does not have to be adjusted.

If the output voltage is adjusted, an even current distribution can be ensured by precisely setting all power supply units that are operated in parallel to the same output voltage.

To ensure symmetrical current distribution we recommend that all cable connections from the power supply unit to the DIN rail are the same length and have the same cross section.

Depending on the system, for parallel connection of more than two power supply units a protective circuit should be installed at each individual device output (e.g., decoupling diode or DC fuse). This prevents high return currents in the event of a secondary device fault.

#### 7.4. Redundancy Operation

Redundant connections are designed for supplying systems, which place particularly high requirements on operational safety. If a fault occurs in the primary circuit of the first power supply unit, the second device automatically takes over the complete power supply without interruption, and vice versa.

For this purpose, the power supply units to be connected in parallel must be large enough that the total current requirements of all loads can be fully met by one power supply unit. External decoupling diodes are required for 100% redundancy.

#### 7.5. Increasing Power

The output current can be increased to  $\mathbf{n} \times \mathbf{I}_N$  where  $\mathbf{n}$  is the number of devices connected in parallel.

Parallel connection for increasing power is used when extending existing systems. A parallel connection is recommended if the power supply unit does not cover the current consumption of the most powerful load. Otherwise, the loads should be divided over independent individual devices.

A maximum of five devices can be connected in parallel.
