

# 500mA, Low Voltage, LDO Regulator with External Bias Supply

## **General Description**

The RT9041E is a low voltage, low dropout linear regulator with an external bias supply input. The bias supply drives the gate of the internal N-MOSFET pass transistor, making these devices ideal for applications that require low voltage outputs from low voltage inputs. The RT9041E provides fixed output voltage from 1V to 2V with 0.1V increments. Adjustable output voltage is available for the RT9041E by using external resistors. Other features include current limit and thermal shutdown to protect regulator from fault conditions.

The RT9041E is available in a WDFN-8L 2x2 package.

## **Ordering Information**

#### Note:

Richtek products are:

- RoHS compliant and compatible with the current requirements of IPC/JEDEC J-STD-020.
- ▶ Suitable for use in SnPb or Pb-free soldering processes.

## **Marking Information**

For marking information, contact our sales representative directly or through a Richtek distributor located in your area.

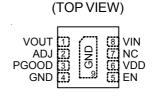

#### **Features**

- ±2% Output Voltage Accuracy
- No Minimum Load Current Required
- 1V to 5.5V Input Supply Voltage
- 3V to 5.5V Input Bias Supply Voltage
- PGOOD Open-Drain Output
- Supports Fixed/Adjustable Output Voltage
- Low Supply Current
- 5μA (max) Shutdown Supply Current
- RoHS Compliant and Halogen Free

## **Applications**

- Set Top Box
- Notebook Computers
- VID Power Supplies
- PDAs
- Cell Phones
- Low Dropout Regulators with External Bias Supply

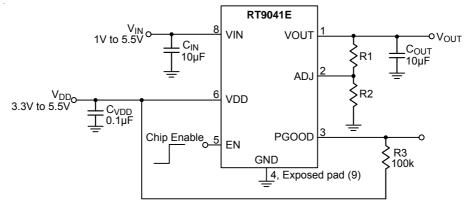

## **Pin Configurations**

WDFN-8L 2x2

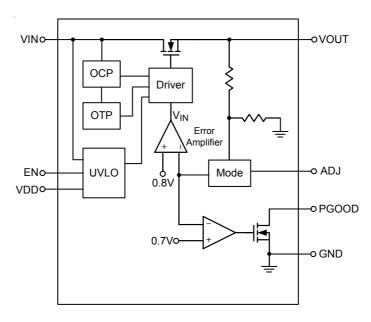

# **Typical Application Circuit**

## **Function Pin Description**

Pin No.	Pin Name	Pin Function			
1	VOUT	Output Voltage.			
2	ADJ	Output Voltage Adjust Pin. Set the output voltage by the internal feedback resistors when ADJ is ground. If external feedback resistors is used, $V_{OUT} = V_{REF} \times (R1 + R2)/R2$ .			
3	PGOOD	Power Good Open Drain Output.			
4, 9 (Exposed pad)	GND	Ground. The exposed pad must be soldered to a large PCB and connected to GND for maximum power dissipation.			
5	EN	Chip Enable (Active-High).			
6	VDD	Supply Voltage of Control Circuitry.			
7	NC	No Internal Connection.			
8	VIN	Supply Input Voltage.

- Note 1. Stresses beyond those listed "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions may affect device reliability.
- Note 2.  $\theta_{JA}$  is measured at  $T_A$  = 25°C on a high effective thermal conductivity four-layer test board per JEDEC 51-7.  $\theta_{JC}$  is measured at the exposed pad of the package.
- Note 3. Devices are ESD sensitive. Handling precaution is recommended.
- Note 4. The device is not guaranteed to function outside its operating conditions.
- Note 5. Guaranteed by Design.

## **Application Information**

The RT9041E is a low voltage, low dropout linear regulator with an external bias supply input, capable of supporting an input voltage range from 1V to 5.5V with a fixed output voltage from 1V to 2V in 0.1V increments.

#### **Supply Voltage Setting**

The bias supply voltage (V<sub>DD</sub>) operates from 3V to 5.5V. For better efficiency, it is suggested to operate V<sub>DD</sub> at 5V when the output voltage is higher than 1V. Figure 1 shows the curves of the recommended  $V_{DD} - V_{OUT}$  range vs. the dropout voltage (V<sub>IN</sub> – V<sub>OUT</sub>) values.

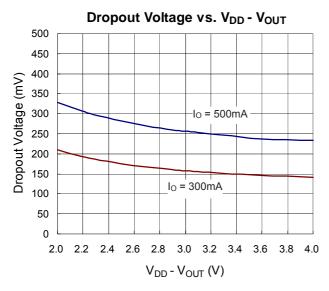

Figure 1. Dropout Voltage vs. V<sub>DD</sub> – V<sub>OUT</sub>

### **Output Voltage Setting**

The RT9041E output voltage is also adjustable from 0.8V to 2.5V via the external resistive voltage divider. The voltage divider resistors can have values up to  $800k\Omega$  because of the very high impedance and low bias current of the sense comparator. The output voltage is set according to the following equation:

$$V_{OUT} = V_{REF} \times \left(1 + \frac{R1}{R2}\right)$$

where V<sub>REF</sub> is the reference voltage with a typical value of 0.8V

#### Chip Enable Operation

The RT9041E goes into sleep mode when the EN pin is in a logic low condition. In this condition, the pass transistor, error amplifier, and band gap are all turned off, reducing the supply current to 1µA (typ.). The EN pin can be directly tied to VIN to keep the part on.

#### **Current Limit**

The RT9041E contains an independent current limit circuitry, which monitors and controls the pass transistor's gate voltage, limiting the output current to 0.7A (typ.).

#### CIN and COUT Selection

Like any low dropout regulator, the external capacitors of the RT9041E must be carefully selected for regulator stability and performance. Using a capacitor of at least 10μF is suitable. The input capacitor must be located at a distance of not more than 0.5 inch from the input pin of the IC. Any good quality ceramic capacitor can be used. However, a capacitor with larger value and lower ESR (Equivalent Series Resistance) is recommended since it will provide better PSRR and line transient response.

The RT9041E is designed specifically to work with low ESR ceramic output capacitor for space saving and performance consideration. Using a ceramic capacitor with value at least  $10\mu F$  and ESR larger than  $40m\Omega$  on the RT9041E output ensures stability. Nevertheless, the RT9041E can still work well with other types of output capacitors due to its wide range of stable ESR. Figure 2 shows the allowable ESR range as a function of load current for various output capacitance. Output capacitors with larger capacitance can reduce noise and improve load transient response, stability, and PSRR. The output capacitor should be located at a distance of not more than 0.5 inch from the output pin of the RT9041E.

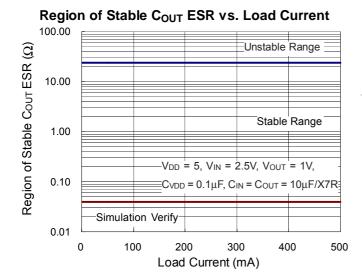

Figure 2. Region of Stable C<sub>OUT</sub> ESR vs. the Load Current

#### **Thermal Considerations**

For continuous operation, do not exceed absolute maximum junction temperature. The maximum power dissipation depends on the thermal resistance of the IC package, PCB layout, rate of surrounding airflow, and difference between junction and ambient temperature. The maximum power dissipation can be calculated by the following formula:

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / \theta_{JA}$$

where  $T_{J(MAX)}$  is the maximum junction temperature,  $T_A$  is the ambient temperature, and  $\theta_{JA}$  is the junction to ambient thermal resistance.

For recommended operating condition specifications, the maximum junction temperature is 125°C. The junction to ambient thermal resistance,  $\theta_{JA}$ , is layout dependent. For WDFN-8L 2x2 packages, the thermal resistance,  $\theta_{JA}$ , is 120°C/W on a standard JEDEC 51-7 four-layer thermal test board. The maximum power dissipation at  $T_A$  = 25°C can be calculated by the following formula :

$$P_{D(MAX)} = (125^{\circ}C - 25^{\circ}C) / (120^{\circ}C/W) = 0.833W$$
 for

WDFN-8L 2x2 package

The maximum power dissipation depends on the operating ambient temperature for fixed  $T_{J(MAX)}$  and thermal resistance,  $\theta_{JA}$ . The derating curve in Figure 3 allows the designer to see the effect of rising ambient temperature on the maximum power dissipation.

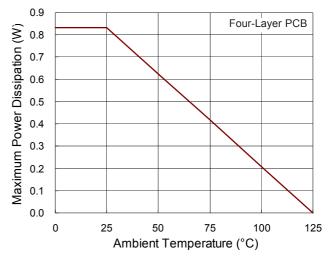

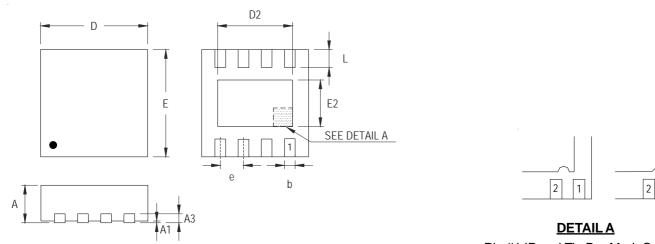

Figure 3. Derating Curve of Maximum Power Dissipation
