

Ultra High Precision Z-Foil Power Resistor in TO-220 Configuration with TCR of $\pm 0.05 \text{ ppm}/^\circ\text{C}$, PCR of $4 \text{ ppm}/\text{W}$ and Load Life Stability of $\pm 0.005 \%$ (50 ppm)

Any value at any tolerance available within resistance range

INTRODUCTION

The Z-Foil Technology provides a significant reduction of the resistive component's sensitivity to ambient temperature variations (TCR) and applied power changes (PCR).

VPR221Z provides high rated power, excellent load life stability, low Temperature Coefficient (TCR) and low Power Coefficient (PCR) - all in one resistor. $\pm 0.05 \text{ ppm}/^\circ\text{C}$ Absolute TCR removes error due to temperature gradients.

By taking advantage of the overall stability and reliability of Bulk Metal[®] Z-Foil resistors, designers can significantly reduce circuit errors and greatly improve overall circuit performances.

Model VPR221Z is a 4 lead kelvin connected device.

1. Maximum is 1.0 % A.Q.L. standard for all specifications except TCR.
2. Whichever is lower.
3. Heat sink chassis dimensions are requirements per MIL-R-39009/1B:

4. Inductance (L) mainly due to the leads.
5. The resolution limit of existing test requirement (within the measurement capability of the equipment, “essentially zero”).
6. μV/°C relates to EMF due to lead temperature difference.
