Low-Power, High-Performance Dual I²S Stereo Audio Codec

MAX9880A

General Description

The MAX9880A is a high-performance, stereo audio codec designed for portable consumer applications such as smartphones and tablets. Operating from a single 1.8V supply to ensure low-power consumption, the MAX9880A offers a variety of input and output configurations for design flexibility. The MAX9880A can be combined with an audio subsystem, such as the MAX9877 or MAX9879, for a complete audio solution for portable applications.

The MAX9880A's stereo differential microphone inputs can support either analog or digital microphones. A stereo single-ended line input, with a configurable pre-amplifier, can either be recorded by the ADC or routed directly to the headphone or line output amplifiers. The stereo headphone amplifiers can be configured as differential, single ended, or capacitorless. The stereo line outputs have dedicated level adjustment.

There are two digital audio interfaces. The primary interface is intended for voiceband applications, while the secondary interface can be used for high performance stereo audio data. Two digital input streams can be processed simultaneously and both digital interfaces support TDM and I²S data formats.

The flexible clocking circuitry utilizes any available 10MHz to 60MHz system clock, eliminating the need for an external PLL and multiple crystal oscillators. Both the ADC and DAC can be operated synchronously or asynchronously in master or slave mode. The ADC can be operated from 8kHz to 48kHz sample rates, while the DAC can be operated up to 96kHz.

The MAX9880A prevents click and pop during volume changes and during power-up and power-down. Audio quality is further enhanced with user-configurable digital filters for voice and audio data. Voiceband filters provide extra attenuation at the GSM packet frequency and greater than 70dB stopband attenuation at $f_s/2$. An I²C or SPI™ serial interface provides control for volume levels, signal mixing, and general operating modes.

The MAX9880A is available in space-saving, 48-bump, 2.7mm x 3.5mm, 0.4mm-pitch WLP and 48-pin, 6mm x 6mm TQFN packages.

Applications

- Cellular Phones
- Tablet PCs
- Portable Gaming Devices
- Portable Multimedia Players

SPI is a trademark of Motorola, Inc.

Features

- ◆ 1.8V Single-Supply Operation
- ◆ 10.6mW Playback Power Consumption
- ◆ 8kHz to 96kHz Stereo DAC with 96dB Dynamic Range
- ◆ 8kHz to 48kHz Stereo ADC with 82dB Dynamic Range
- ◆ Support for Any Master Clock Between 10MHz to 60MHz
- ◆ Stereo Microphone Inputs Support Digital Microphones
- ◆ Stereo Headphone Amplifiers: Differential (30mW), Single-Ended, or Capacitorless (10mW)
- ◆ Stereo Line Inputs and Stereo Line Outputs
- ◆ Voiceband Filters with Stopband Attenuation Greater than 70dB
- ◆ Battery-Measurement Auxiliary ADC
- ◆ Comprehensive Headset Detection
- ◆ Dual I²S- and TDM-Compatible Digital Audio Interfaces
- ◆ I²C- or SPI-Compatible Control Bus with 3.6V Tolerant Inputs

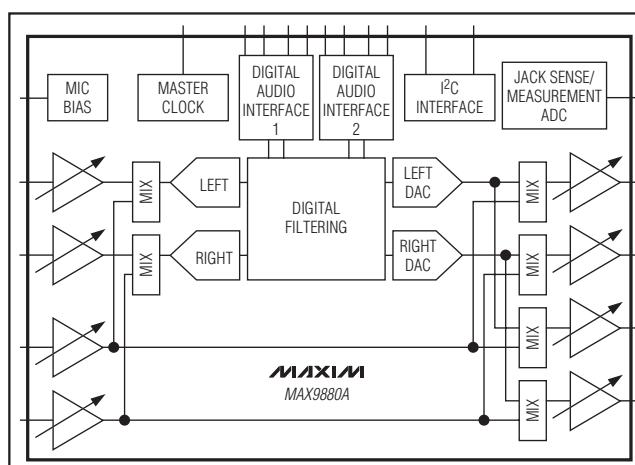

Ordering Information

| PART | TEMP RANGE | PIN-PACKAGE |
|--------------|----------------|-------------|
| MAX9880AEWM+ | -40°C to +85°C | 48 WLP |
| MAX9880AETM+ | -40°C to +85°C | 48 TQFN-EP* |

+Denotes a lead(Pb)-free/RoHS-compliant package.

*EP = Exposed pad.

Simplified Block Diagram

Functional Diagram/Typical Operating Circuit appears at end of data sheet.

Low-Power, High-Performance Dual I²S Stereo Audio Codec

ABSOLUTE MAXIMUM RATINGS

(Voltages with respect to AGND.)

| | |
|---|----------------------------------|
| DVDD, AVDD, PVDD | -0.3V to +2V |
| DVDDS1, JACKSNS, MICVDD | -0.3V to +3.6V |
| DGND, PGND | -0.1V to +0.1V |
| PREG, REF, REG | -0.3V to (VAVDD + 0.3V) |
| MICBIAS | -0.3V to (VMICVDD + 0.3V) |
| MCLK, LRCLKS1, BCLKS1, SDINS1, SDOUTS1 | -0.3V to (VDVDDS1 + 0.3V) |
| X1, X2, LRCLKS2, BCLKS2, SDINS2, SDOUTS2, DOUT, MODE | -0.3V to (VDVDD + 0.3V) |
| SDA/DIN, SCL/SCLK, CS, IRQ | -0.3V to +3.6V |
| LOUTP, LOUTN, ROUTP, ROUTN, LOUTL, LOUTR | (VPGND - 0.3V) to (VPVDD + 0.3V) |

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

PACKAGE THERMAL CHARACTERISTICS (Note 1)

TQFN

| | |
|--|--------|
| Junction-to-Ambient Thermal Resistance (θ_{JA}) | 27°C/W |
| Junction-to-Case Thermal Resistance (θ_{JC}) | 1°C/W |

| | |
|--|-------------------------|
| LINL, LINR, MICLP/DIGMICDATA, MICLN/DIGMICCLK, MICRP/SPDMDATA, MICRN/SPDMCLK | -0.3V to (VAVDD + 0.3V) |
| Continuous Power Dissipation ($T_A = +70^\circ\text{C}$) | |
| 48-Bump WLP (derate 12.5mW/°C above +70°C) |1000mW |
| 48-Pin TQFN (derate 37mW/°C above +70°C) |2963mW |
| Junction Temperature |+150°C |
| Operating Temperature Range |-40°C to +85°C |
| Storage Temperature Range |-65°C to +150°C |
| Lead Temperature (soldering, 10s) |+300°C |
| Soldering Temperature (reflow) |+260°C |

| | |
|--|--------|
| WLP | |
| Junction-to-Ambient Thermal Resistance (θ_{JA}) | 42°C/W |
| Junction-to-Case Thermal Resistance (θ_{JC}) | 5°C/W |

Note 1: Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to www.maxim-ic.com/thermal-tutorial.

ELECTRICAL CHARACTERISTICS

($V_{AVDD} = VPVDD = VMICVDD = DVDD = DVDDS1 = +1.8\text{V}$, $R_L = \infty$, headphone load (R_L) connected between _OUTP and _OUTN, differential modes, $C_{REF} = 2.2\mu\text{F}$, $C_{MICBIAS} = CPREG = CREG = 1\mu\text{F}$, $AVPRE = +20\text{dB}$, $AVPGAM = 0\text{dB}$, $AVDAC = 0\text{dB}$, $AVLINE = +20\text{dB}$, $AVVOL = 0\text{dB}$, $AVLO = 0\text{dB}$, $f_{MCLK} = 13\text{MHz}$, $T_A = T_{MIN}$ to T_{MAX} , unless otherwise noted. Typical values are at $T_A = +25^\circ\text{C}$.) (Note 2)

| PARAMETER | SYMBOL | CONDITIONS | | MIN | TYP | MAX | UNITS |

| Minimum Output Data Enable Time | t_{DEN} | | | 5 | | ns |
| Minimum Output Data Disable Time | t_{DZ} | | | 5 | | ns |

Note 2: The MAX9880A is 100% production tested at $T_A = +25^\circ C$. Specifications over temperature limits are guaranteed by design.

Note 3: Clocking all zeros into the DAC. Master mode. Differential headphone mode.

Note 4: DAC performance measured at headphone outputs.

Note 5: Dynamic range measured using the EIAJ method. -60dBFS 1kHz output signal, A-weighted, and normalized to 0dBFS. $f = 20Hz$ to $20kHz$.

Note 6: Performance measured using microphone inputs, unless otherwise stated.

Note 7: Performance measured using line inputs.

Note 8: Performance measured using line inputs to line outputs.

Note 9: Performance measured using DAC. $f_{MCLK} = 12.288MHz$, $f_{LRCLK} = 48kHz$, unless otherwise stated.

Note 10: LRCLK can be any rate in the indicated range. Asynchronous or noninteger MCLK/LRCLK ratios can exhibit some full-scale performance degradation compared to synchronous integer-related MCLK/LRCLK ratios.

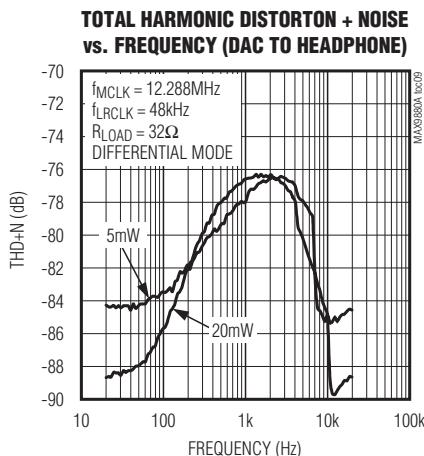

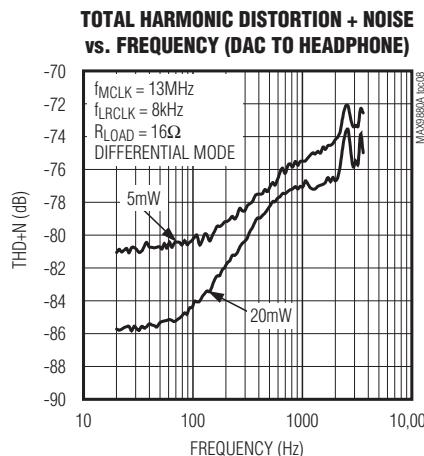

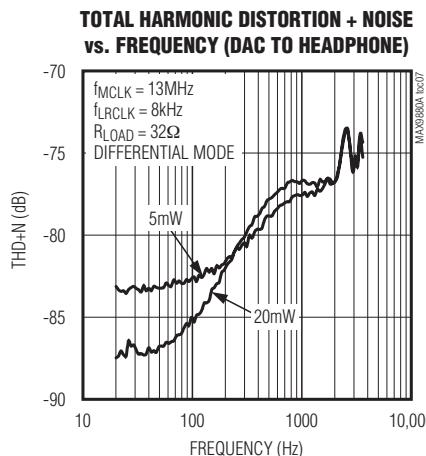

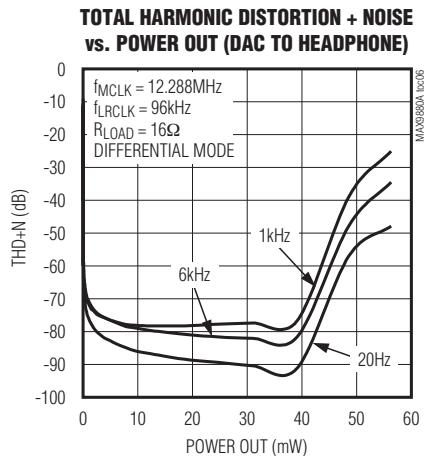

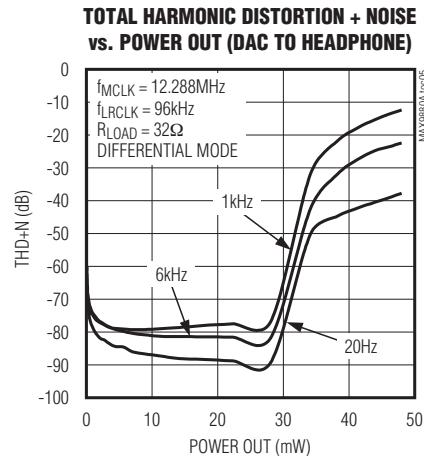

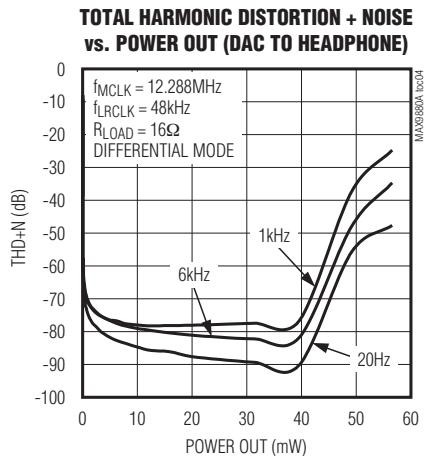

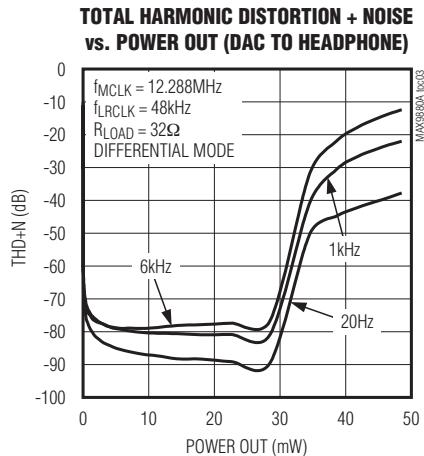

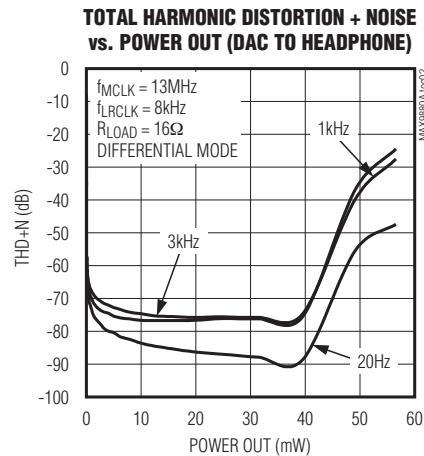

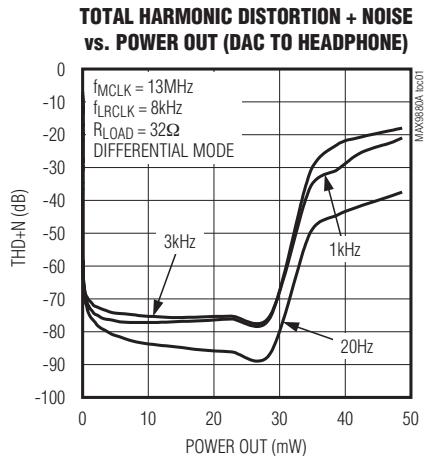

Note 11: In master-mode operation, the accuracy of the MCLK input proportionally determines the accuracy of the sample clock rate.

Note 12: C_B is in pF.

Low-Power, High-Performance Dual I²S Stereo Audio Codec

Pin Description

| PIN | | NAME | FUNCTION |
|------------------------------|-------------------|----------------------|--|
| TQFN-EP | WLP | | |
| 1 | B2 | SDA/DIN | I ² C Serial-Data Input/Output (MODE = 0). Connect a pullup resistor to DVDD for full output swing. SPI compatible serial-data input (MODE = 1). |
| 2 | B3 | SCL/SCLK | I ² C Serial-Clock Input (MODE = 0). Connect a pullup resistor to DVDD for full output swing. SPI-compatible serial clock input (MODE = 1). |
| 3 | A2 | X1 | Crystal Oscillator Input. Connect load capacitor and one terminal of the crystal to this pin. Acceptable input frequency range: 10MHz to 30MHz. |
| 4 | A3 | X2 | Crystal Oscillator Output. Connect load capacitor and second terminal of the crystal to this pin. |
| 5 | B4 | CS | SPI-Compatible, Active-Low Chip-Select Input |
| 6 | B5 | DOUT | SPI-Compatible Serial-Data Output |
| 7 | A5 | MODE | I ² C/SPI Mode Select Input (MODE = 0 for I ² C mode, MODE = 1 for SPI mode) |
| 8 | A4 | IRQ | Hardware Interrupt Output. IRQ can be programmed to go low when bits in the status register 0x00 are set. Read status register 0x00 to clear IRQ once set. Repeat faults have no effect on IRQ until it is cleared by reading the I ² C status register 0x00. Connect a 10kΩ pullup resistor to DVDD for full output swing. |
| 9 | A6 | AVDD | Analog Power Supply. Bypass to AGND with a 1μF capacitor. |
| 10 | B6 | REF | Converter Reference. Bypass to AGND with a 2.2μF capacitor (1.23V nominal). |
| 11, 14, 28, 33, 35, 48 | C4, D4, C5, D6 | N.C. | No Connection. Connect to GND. |
| 12 | A7 | PREG | Positive Internal Regulated Supply. Bypass to AGND with a 1μF capacitor (1.6V nominal). |
| 13 | C6 | REG | PREG/2 Voltage Reference. Bypass to AGND with a 1μF capacitor (0.8V nominal) |
| 15 | A8 | AGND | Analog Ground |
| 16 | B7 | MICVDD | Microphone Bias Power Supply. Bypass to AGND with a 1μF capacitor. |
| 17 | B8 | MICBIAS | Low-Noise Microphone Bias. Connect a 2.2kΩ to 470Ω resistor to the positive output of the microphone. Bypass to AGND with a 1μF capacitor. |
| 18 | C7 | MICLN/ DIGMICCLK | Left Negative Differential Microphone Input. AC-couple a microphone with a series 1μF capacitor. Also digital microphone clock output. Selectable through I ² C. |
| 19 | D7 | MICLP/ DIGMICDATA | Left Positive Differential Microphone Input. AC-couple a microphone with a series 1μF capacitor. Also digital microphone data input. Selectable through I ² C. |
| 20 | C8 | MICRP/ SPDMDATA | Right Positive Differential Microphone Input or SPDM Data Output. AC-couple a microphone with a series 1μF capacitor. Selectable through I ² C. |
| 21 | D8 | MICRN/ SPDMCLK | Right Negative Differential Microphone Input or SPDM Clock Output. AC-couple a microphone with a series 1μF capacitor. Selectable through I ² C. |
| 22 | D5 | JACKSNS/AUX | Jack Sense. Detects the presence or absence of a jack. See the Headset Detection section. When used as an auxiliary ADC input, AUX is used to measure DC voltages. |

Low-Power, High-Performance Dual I²S Stereo Audio Codec

Pin Description (continued)

| PIN | | NAME | FUNCTION |
|----------------|------------|-------------|--|
| TQFN-EP | WLP | | |
| 23 | E8 | LINL | Left-Line Input. AC-couple analog audio signal to LINL with a 1µF capacitor. |
| 24 | F8 | LINR | Right-Line Input. AC-couple analog audio signal to LINR with a 1µF capacitor. |
| 25 | F7 | LOUTR | Right-Line Output |
| 26 | E7 | LOUTL | Left-Line Output |
| 27 | E6, F6 | PGND | Headphone Power Ground |
| 29 | E5 | ROUTP | Positive Right-Channel Headphone Output. Connect directly to the load in differential and capacitorless mode. AC-couple to the load in single-ended mode. |
| 30 | F5 | ROUTN | Negative Right-Channel Headphone Output. Unused in capacitorless and single-ended mode. |
| 31 | F4 | LOUTN | Negative Left-Channel Headphone Output. Common headphone return in capacitorless mode. Unused in single-ended mode. |
| 32 | E4 | LOUTP | Positive Left-Channel Headphone Output. Connect directly to the load in differential and capacitorless mode. AC-couple to the load in single-ended mode. |
| 34 | E3, F3 | PVDD | Headphone Power Supply. Bypass to PGND with a 1µF capacitor. |
| 36 | F2 | DVDDS1 | S1 Digital Audio Interface Power-Supply Input. Bypass to DGND with a 1µF capacitor. |
| 37 | F1 | SDOUTS1 | S1 Digital Audio Serial-Data ADC Output |
| 38 | D3 | SDINS1 | S1 Digital Audio Serial-Data DAC Input |
| 39 | E1 | LRCLKS1 | S1 Digital Audio Left-Right Clock Input/Output. LRCLKS1 is the audio sample rate clock and determines whether the audio data on SDINS1 is routed to the left or right channel. In TDM mode, LRCLKS1 is a frame sync pulse. LRCLKS1 is an input when the MAX9880A is in slave mode and an output when in master mode. |
| 40 | E2 | BCLKS1 | S1 Digital Audio Bit Clock Input/Output. BCLKS1 is an input when the MAX9880A is in slave mode and an output when in master mode. |
| 41 | D1 | MCLK | Master Clock Input. Acceptable input frequency range: 10MHz to 60MHz. |
| 42 | D2 | SDOUTS2 | S2 Digital Audio Serial-Data ADC Output |
| 43 | C1 | SDINS2 | S2 Digital Audio Serial-Data DAC Input |
| 44 | C2 | LRCLKS2 | S2 Digital Audio Left-Right Clock Input/Output. LRCLKS2 is the audio sample rate clock and determines whether the audio data on SDINS2 is routed to the left or right channel. In TDM mode, LRCLKS2 is a frame sync pulse. LRCLKS2 is an input when the MAX9880A is in slave mode and an output when in master mode. |
| 45 | C3 | BCLKS2 | S2 Digital Audio Bit Clock Input/Output. BCLKS2 is an input when the MAX9880A is in slave mode and an output when in master mode. |
| 46 | B1 | DVDD | Digital Power Supply. Supply for the digital core and I ² C/SPI interface. Bypass to DGND with a 1.0µF capacitor. |
| 47 | A1 | DGND | Digital Ground |
| — | — | EP | Exposed Pad. Connect the exposed thermal pad to AGND. |

MAX9880A

Low-Power, High-Performance Dual I²S Stereo Audio Codec

Detailed Description

The MAX9880A is a low-power stereo audio codec designed for portable applications requiring minimum power consumption.

The stereo playback path accepts digital audio through flexible digital audio interfaces compatible with I²S, TDM, and left-justified audio signals. The MAX9880A can process two simultaneous digital input streams that can be mixed digitally. The primary interface is intended for voiceband applications, while the secondary interface can be used for stereo audio data. An oversampling sigma-delta DAC converts the mixed incoming digital data stream to analog audio and outputs through the stereo headphone amplifier and stereo-line outputs. The headphone amplifier can be configured in differential, single-ended, and capacitorless output modes.

The stereo record path has two differential analog microphone inputs with selectable gain. The microphones are powered by an integrated microphone bias. The MAX9880A can retask the left analog microphone input to accept data from up to two digital microphones. An oversampling sigma-delta ADC converts the microphone signals and outputs the digital bit stream over the digital audio interface. An auxiliary ADC allows accurate measurements of DC voltages by retasking the right audio ADC. DC voltages can be read through the registers.

The MAX9880A also includes two line inputs. These inputs allow a stereo single-ended signal to be gain adjusted and then recorded by the ADCs and output by the headphone amplifier and line output amplifiers. A jack detection function allows the detection of headphone, microphone, and headset jacks. Insertion and removal events can be programmed to trigger a hardware interrupt and flag a register bit.

The MAX9880A's flexible clock circuitry utilizes a programmable clock divider and a digital PLL to allow the DAC and ADC to operate at maximum dynamic range for all combinations of master clock (MCLK) and sample rate (LRCLK) without consuming extra supply current. Any master clock between 10MHz and 60MHz is supported as are all sample rates from 8kHz to 48kHz for the record path and 8kHz to 96kHz for the playback path. Master and slave modes are supported for maximum flexibility.

The right analog microphone input can be retasked to output SPDM data. Integrated digital filtering provides a range of notch and highpass filters for both the playback and record paths to limit undesirable low-frequency signals and GSM transmission noise. The digital filtering provides attenuation of out-of-band energy by over 70dB, eliminating audible aliasing. A digital sidetone function allows audio from the record path to be summed into the playback path after digital filtering.

I²C/SPI Registers

Forty internal registers program and report the status of the MAX9880A. Table 1 lists all of the registers, their addresses, and power-on-reset states. Registers 0x00–0x03 are read-only while all of the other registers are read/write. Write zeros to all unused bits in the register table when updating the register, unless otherwise noted. All bits in the read-only registers are not programmable. Read operations of unused bits return zero.

I²C Slave Address

The MAX9880A is preprogrammed with a slave address of 0x20 or 0010000. The address is defined as the 7 most significant bits (MSBs) followed by the read/write bit. Set the read/write bit to 1 to configure the MAX9880A to read mode. Set the read/write bit to zero to configure the MAX9880A to write mode. The address is the first byte of information sent to the MAX9880A after the START (S) condition.

*Reserved.

Grayed boxes = Not used.

Note: Register addresses listed are for I²C. To get the SPI address, add 0x200 with the following exception: Register 0xFF is not accessible through SPI.

Device Status

Status registers 0x00 and 0x01 are read-only registers that report the status of various device functions. The status register bits are cleared upon reading the status register and are set the next time the event occurs. Registers 0x02 and 0x03 report the DC level applied to AUX. See the ADC section for more details.

Bits in status register 0x00 are set when an alert condition exists. All bits in status register 0x00 are automatically cleared upon a read operation of the register and are set again if the condition remains or occurs following the read of this register.

Table 2. Status Register

| REGISTER | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 | REGISTER ADDRESS (SEE NOTE) |
|-------------|------------|-----|-----|----|----|----|------|----|-----------------------------|

Low-Power, High-Performance Dual I²S Stereo Audio Codec

Table 3. Status Register Bits

| BITS | FUNCTION | |
|-----------|--|--|
| CLD | Clip Detect Flag. Indicates that a signal has become clipped in the ADC or DAC. To resolve a clip condition in the signal path, the DAC gain settings and analog input gain settings should be lowered. As the CLD bit does not indicate where the overload has occurred, identify the source by lowering gains individually. | |
| SLD | Slew Level Detect Flag. When volume or gain changes are made, the slewing circuitry smoothly steps through all intermediate settings. When SLD is set high, all slewing has completed and the volume or gain is at its final value. SLD is also set when soft start or stop is complete. | |
| ULK | Digital PLL Unlock Flag. Indicates that the digital audio PLL has become unlocked and digital signal data is not reliable. | |
| JDET | Headset Configuration Change Flag. JDET reports changes in JKSN[1:0]. Changes to JKSN[1:0] are debounced before setting JDET. The debounce period is programmable using the JDEB bits. | |
| JKSN[1:0] | JKSN reports the status of the JACKSNS pin when JDETEN = 1. JKSN is not debounced and should be interpreted according to the following information. | |
| | JKSN[1:0] | DESCRIPTION |
| | 00 | JACKSNS is below V _{TH2} . |
| | 01 | JACKSNS is between V _{TH1} and V _{TH2} . |
| | 10 | Invalid. |
| AUX | Auxiliary Input Measurement. AUX is a 16-bit signed two's complement number representing the voltage measured at JACKSNS/AUX. Before reading a value from AUX, set AUXCAP to 1 to ensure a stable reading. After reading the value, set AUXCAP to 0. | |
| | Use the following formula to convert the AUX value into an equivalent JACKSNS/AUX voltage: | |
| | $\text{Voltage} = 0.738V \times \left(\frac{\text{AUX}}{k} \right)$ <p>k = AUX value when AUXGAIN = 1. See AUXGAIN for details on determining the value of k, the calibration constant.</p> | |

MAX9880A

Low-Power, High-Performance Dual I²S Stereo Audio Codec

Hardware Interrupts

Hardware interrupts are reported on the open-drain IRQ pin. When an interrupt occurs, IRQ remains low until the interrupt is serviced by reading the status register 0x00.

If a flag is set, it is reported as a hardware interrupt only if the corresponding interrupt enable is set. Each bit enables interrupts for the status flag in the respective bit location in register 0x00.

Table 4. Interrupt Enable

| REGISTER | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 | REGISTER ADDRESS (SEE NOTE) |
|------------------|------|------|------|----|----|----|-------|----|-----------------------------|
| Interrupt Enable | ICLD | ISLD | IULK | 0 | 0* | 0* | IJDET | 0 | 0x04 |

*Reserved.

Grayed boxes = Not used.

Note: Register addresses listed are for I²C. To get the SPI address, add 0x200 with the following exception: Register 0xFF is not accessible through SPI.

Clock Control

The MAX9880A can work with a master clock (MCLK) supplied from any system clock within the 10MHz to 60MHz range. Internally the MAX9880A requires a 10MHz to 20MHz clock. A prescaler divides MCLK by 1, 2, or 4 to create the internal clock (PCLK). PCLK is used to clock all portions of the MAX9880A.

The MAX9880A can support any sample rate from 8kHz to 48kHz for the digital audio path DAI1 (DAC and ADC) and 8kHz to 96kHz for the DAI2 (high-fidelity DAC path), including all common sample rates (8kHz, 16kHz, 24kHz, 32kHz, 44.1kHz, 48kHz, 96kHz). To accommodate a wide range of system architectures, the MAX9880A supports three main clocking modes:

- **Normal mode:** This mode uses a 15-bit clock divider coefficient to set the sample rate relative to the prescaled MCLK input (PCLK). This allows high

flexibility in both the MCLK and LRCLK frequencies and can be used in either master or slave mode.

- **Exact integer mode:** Common MCLK frequencies (12MHz, 13MHz, 16MHz, and 19.2MHz) can be programmed to operate in exact integer mode for both 8kHz and 16kHz sample rates. In these modes, the MCLK and LRCLK rates are selected by using the FREQ1 bits instead of the NI high, NI low, and PLL control bits.
- **PLL mode:** When operating in slave mode, a PLL can be enabled to lock onto externally generated LRCLK signals that are not integer related to PCLK. Prior to enabling the interface, program NI to the nearest desired ratio and set the NI[0] = 1 to enable the PLL's rapid lock mode. If NI[0] = 0, then NI is ignored and PLL lock time is slower.

Table 5. System and Audio Clock Registers

| REGISTER | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 | REGISTER ADDRESS (SEE NOTE) |
|---------------------------------|------|----|-------|-----------|-------|----|-------------|----|-----------------------------|

Low-Power, High-Performance Dual I²S Stereo Audio Codec

Table 5. System and Audio Clock Registers (continued)

| BITS | FUNCTION | | | |
|-----------|--|-------------------|--------------------|-------------------|
| PSCLK | MCLK Prescaler. Divides MCLK down to generate a PCLK between 10MHz and 20MHz. 00 = Disable clock for low-power shutdown. 01 = Select if MCLK is between 10MHz and 20MHz. PCLK = MCLK. 10 = Select if MCLK is between 20MHz and 40MHz. PCLK = MCLK/2. 11 = Select if MCLK is greater than 40MHz. PCLK = MCLK/4. | | | |
| FREQ1 | Exact Integer Modes. Allows integer sampling for specific PCLK (prescaled MCLK) frequencies and 8kHz or 16kHz sample rates. | | | |
| | FREQ1[3:0] | PCLK (MHz) | LRCLK (kHz) | PCLK/LRCLK |
| | 0x00 | | Normal or PLL mode | |
| | 0x1–0x7 | Reserved | Reserved | Reserved |
| | 0x8 | 12 | 8 | 1500 |
| | 0x9 | 12 | 16 | 750 |
| | 0xA | 13 | 8 | 1625 |
| | 0xB | 13 | 16 | 812.5 |
| | 0xC | 16 | 8 | 2000 |
| | 0xD | 16 | 16 | 1000 |
| | 0xE | 19.2 | 8 | 2400 |
| | 0xF | 19.2 | 16 | 1200 |
| | Modes 0x8 to 0xF are available in either master or slave mode. In slave mode, if the indicated PCLK/LRCLK ratio cannot be guaranteed, use PLL mode instead. | | | |
| PLL1/PLL2 | PLL Mode Enable 0 = (Valid for slave and master mode) The frequency of LRCLK is set by the NI divider bits. In master mode, the MAX9880A generates LRCLK using the specified divide ratio. In slave mode, the MAX9880A expects an LRCLK as specified by the divide ratio. 1 = (Valid for slave mode only) A digital PLL locks on to any externally supplied LRCLK signal. | | | |
| RLK1/RLK2 | Rapid Lock Mode. To enable rapid lock mode set NI_ to the nearest desired ratio and set RLK_ = 1 before enabling the interface. | | | |
| NI1/NI2 | Normal Mode LRCLK Divider. When PLL = 0, the frequency of LRCLK is determined by NI. See Table 6 for common NI values. For LRCLK = 8kHz to 48kHz operation (DHF = 0 for DAI2): $NI = (65,536 \times 96 \times f_{LRCLK})/f_{PCLK}$ $f_{LRCLK} = LRCLK \text{ frequency}$ $f_{PCLK} = \text{Prescaled internal MCLK frequency (PCLK)}$ For LRCLK > 50kHz operation (DHF = 1 for DAI2): $NI = (65,536 \times 48 \times f_{LRCLK})/f_{PCLK}$ $f_{LRCLK} = LRCLK \text{ frequency}$ $f_{PCLK} = \text{Prescaled internal MCLK frequency (PCLK)}$ | | | |

Digital Audio Interface

The MAX9880A's dual digital audio interface supports a wide range of operating modes to ensure maximum compatibility. See Figures 1 to 5 for timing diagrams. In master mode, the MAX9880A outputs LRCLK and BCLK, while in slave mode they are inputs. When operating in master mode, BCLK can be configured in a number of ways to ensure compatibility with other audio devices.

The MAX9880A has two sets of digital audio interface pins, S1 and S2, that can be connected to one of two digital audio paths, DAI1 or DAI2.

DAI1: Digital Audio Path 1 Operation

- DAC path with DR of 90dB and ADC path with DR of 82dB

- DAC path connectable to either S1 or S2
- ADC path connectable to either S1 or S2
- 8kHz to 48kHz sample rates
- I²S and TDM-compatible modes
- Voice filters or audio filter modes

DAI2: Digital Audio Path 2 Operation

- High-fidelity DAC path with DR of 96dB
- DAC path connectable to either S1 or S2
- 8kHz to 96kHz sample rates
- I²S and TDM-compatible modes
- Audio FIR filters
- No ADC clock control from DAI2 sample clock and no voice filter modes available in DAI2

Low-Power, High-Performance Dual I²S Stereo Audio Codec

Table 7. Digital Audio Interface Registers

| REGISTER | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 | REGISTER ADDRESS (SEE NOTE) |
|---------------------------|--------|------|--------|--------|---------------|------|-------|-----|-----------------------------|
| DAI1 CONFIGURATION | | | | | | | | | |
| Interface Mode A | MAS1 | WCI1 | BCI1 | DLY1 | HIZOFF1 | TDM1 | FSW1 | 0 | 0x08 |
| Interface Mode B | DL1 | SEL1 | SDOEN1 | SDIEN1 | DMONO1 | | BSEL1 | | 0x09 |
| Time-Division Multiplex | SLOTL1 | | SLOTR1 | | SLOTDLY1[3:0] | | | | 0x0A |
| DAI2 CONFIGURATION | | | | | | | | | |
| Interface Mode A | MAS2 | WCI2 | BCI2 | DLY2 | HIZOFF2 | TDM2 | FSW2 | WS2 | 0x0D |
| Interface Mode B | DL2 | SEL2 | SDOEN2 | SDIEN2 | DHF | | BSEL2 | | 0x0E |
| Time-Division Multiplex | SLOTL2 | | SLOTR2 | | SLOTDLY2[3:0] | | | | 0x0F |

Grayed boxes = Not used.

Note: Register addresses listed are for I²C. To get the SPI address, add 0x200 with the following exception: Register 0xFF is not accessible through SPI.

| BITS | FUNCTION |
|-----------|---|
| MAS1/2 | Master Mode 0 = The MAX9880A operates in slave mode with LRCLK and BCLK configured as inputs. 1 = The MAX9880A operates in master mode with LRCLK and BCLK configured as outputs. |
| WCI1/2 | LRCLK Invert (TDM1/2 = 0) 0 = Left-channel data is input and output while LRCLK is low. 1 = Right-channel data is input and output while LRCLK is low. |
| BCI1/2 | BCLK Invert In master and slave modes: 0 = SDIN is latched into the part on the rising edge of BCLK. SDOUT transitions immediately after the rising edge of BCLK. 1 = SDIN is latched into the part on the falling edge of BCLK. SDOUT transitions immediately after the falling edge of BCLK. In master mode: 0 = LRCLK changes state immediately after the rising edge of BCLK. 1 = LRCLK changes state immediately after the falling edge of BCLK. |
| DLY1/2 | Delay Mode. DLY1/2 have two different functions in TDM and non-TDM mode. In Non-TDM Mode (TDM1/TDM2 = 0): The functionality is as follows: 1 = The most significant bit of an audio word is latched at the second BCLK edge after the LRCLK transition. 0 = The most significant bit of an audio word is latched at the first BCLK edge after the LRCLK transition. In TDM Mode (TDM1/TDM2 = 1): The functionality is as follows: 1 = The HOLD time on the SDOUT output is increased to be greater than 150ns. 0 = The HOLD time on the SDOUT output is the default (greater than 20ns but less than 150ns). |
| HIZOFF1/2 | SDOUT High-Impedance Mode 0 = SDOUT goes to a high-impedance state after all data bits have been transferred out of the MAX9880A, allowing SDOUT to be shared by other devices. 1 = SDOUT is set either high or low after all data bits have been transferred out of the MAX9880A. Note: High-impedance mode is intended for use when TDM = 1. |

MAX9880A

Low-Power, High-Performance Dual I²S Stereo Audio Codec

Table 7. Digital Audio Interface Registers (continued)

| BITS | FUNCTION | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--|--|------|-------------|---------|------------------|-------------------|----------------------------|---------------------------------------|------------------|-------------------|----------------------------|---|---|---|---------------------------------------|---|---|---|---|---|---|------------------------------------|---|---|---|---|---|---|------------------------------------|---|---|---|---|---|---|--|---|---|---|---|---|---|--|---|---|---|---|---|---|
| TDM1/2 | TDM Mode Select 1 = Enables time-division multiplex mode and configures the audio interface to accept PCM data. 0 = Disables time-division multiplex mode. LRCLK signal polarity indicates left and right audio. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| FSW1/2 | Frame Sync Width 1 = Frame sync pulse extended to the width of the entire 16-bit first slot 0 data word (TDM1/TDM2 = 1 only; SLOTDLY[0] must be 0 when FSW is set to 1). 0 = Frame sync pulse is 1 bit wide. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| WS2 | Word Size 0 = The number of bits per input data word sample is 16 bits, and at least 16 BCLKs per input word are required. 1 = The number of bits per input data word sample is 18 bits, and at least 18 BCLKs per input word transfer is required. These control bits are only recognized when TDM1/TDM2 are cleared to 0. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| DL1/2 | Data Loop. Enabling of these bits provides a bridge from one DAI interface to the other. Data format looping could occur in both directions simultaneously. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | <table border="1"> <thead> <tr> <th>BIT</th><th>DESCRIPTION</th></tr> </thead> <tbody> <tr> <td>DL1 = 0</td><td>Normal operation</td></tr> <tr> <td>DL1 = 1, SEL2 = 1</td><td>Enables SDINS1 to SDOUTS2.</td></tr> <tr> <td>DL2 = 0</td><td>Normal operation</td></tr> <tr> <td>DL2 = 1, SEL1 = 0</td><td>Enables SDINS2 to SDOUTS1.</td></tr> </tbody> </table> | BIT | DESCRIPTION | DL1 = 0 | Normal operation | DL1 = 1, SEL2 = 1 | Enables SDINS1 to SDOUTS2. | DL2 = 0 | Normal operation | DL2 = 1, SEL1 = 0 | Enables SDINS2 to SDOUTS1. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| DMONO1 | Mono Playback Mode 0 = Stereo data input on DAI1 path is processed separately. 1 = Stereo data input on DAI1 path is mixed to a single channel and routed to both the left and right DAC. When operating in mono voice mode (MODE = 1), stereo data may still be input through DAI1 path and optionally mixed using DMONO1 = 1. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Low-Power, High-Performance Dual I²S Stereo Audio Codec

Table 7. Digital Audio Interface Registers (continued)

| BITS | FUNCTION | |
|----------------------|--|---|
| | BCLK Select. Configures BCLK when operating in master mode. BSEL has no effect in slave mode. Set BSEL = 010, unless sharing the bus with multiple devices. | |
| BSEL1/2 | BSEL | DESCRIPTION |
| | 000 | Off (BCLK output held low) |
| | 001 | 64x LRCLK (192x internal clock divided by 3) |
| | 010 | 48x LRCLK (192x internal clock divided by 4) |
| | 011 | 128x LRCLK (Note: Not a valid BSEL2 choice when DHF = 1.) |
| | 100 | PCLK/2 |
| | 101 | PCLK/4 |
| | 110 | PCLK/8 |
| | 111 | PCLK/16 |
| SLOTL1/2 SLOTR1/2 | TDM Slot Select. Selects the time slot to use for left/right data according to the following information when operating in time-division multiplex mode. | |
| | SLOT | DESCRIPTION |
| | 00 | Time slot 1 |
| | 01 | Time slot 2 |
| | 10 | Time slot 3 |
| | 11 | Time slot 4 |
| SLOTDLY1/2 | Slot Data Delay (SLOTDLY1/SLOTDLY2) In TDM Mode: Configures the data delay for each slot in TDM mode of operation according to the following information. In Non-TDM Mode (TDM = 0): SLOTDLY[1:0] does not have any effect. | |
| | SLOTDLY1/2[3:0] | DESCRIPTION |
| | 0xxx | Data for slot 4 begins immediately. |
| | 1xxx | Data for slot 4 delayed 1 BCLK cycle. |
| | x0xx | Data for slot 3 begins immediately. |
| | x1xx | Data for slot 3 delayed 1 BCLK cycle. |
| | xx0x | Data for slot 2 begins immediately. |
| | xx1x | Data for slot 2 delayed 1 BCLK cycle. |
| | xxx0 | Data for slot 1 begins immediately. |
| DHF | DAC High Sample Rate Mode (DHF) (Valid only for DAI2 audio path) 1 = LRCLK is greater than 50kHz. 4x FIR interpolation filter used. 0 = LRCLK is less than 50kHz. 8x FIR interpolation filter used. | |

Low-Power, High-Performance Dual I²S Stereo Audio Codec

Digital Filtering

The MAX9880A incorporates both IIR (voice) and FIR (audio) digital filters to accommodate a wide range of audio sources. The IIR filters provide over 70dB of

stopband attenuation as well as selectable highpass filters. The FIR filters provide low power consumption and are linear phase to maintain stereo imaging.

Table 9. Digital Filtering Register

Grayed boxes = Not used.

Note: Register addresses listed are for I²C. To get the SPI address, add 0x200 with the following exception: Register 0xFF is not accessible through SPI.

The MAX9880A supports stereo PDM outputs. The PDM signals consist of PDM data outputs (SPDMDATA) and a clock output (SPDMCLK). The mixer at the input to the

PDM modulators allows a mix/mux of the audio digital data stream from the digital audio ports SDINS1 and SDINS2. Figure 5 shows the SPDM interface timing diagram.

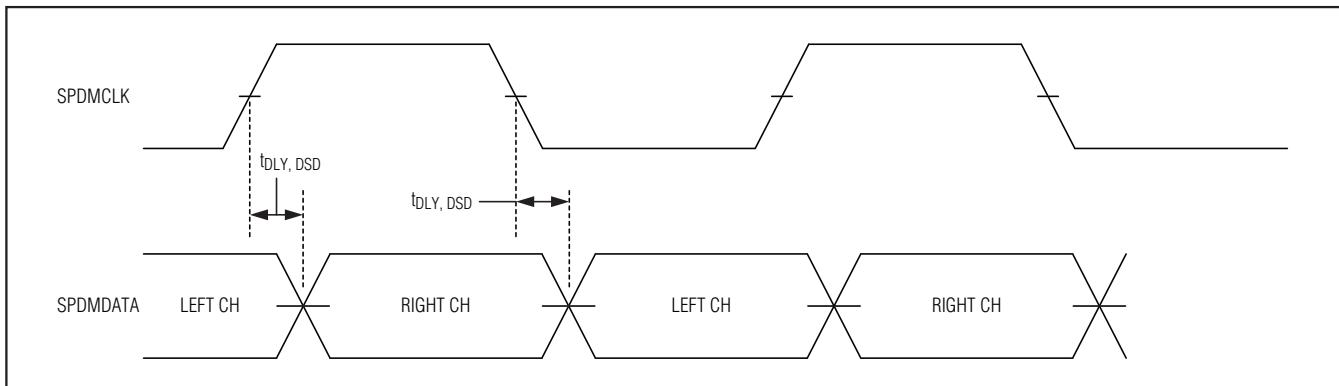

Figure 5. SPDM Timing Diagram

| BITS | FUNCTION | | | | | | | | | | |

Digital Gain Control

The MAX9880A includes gain adjustment for the playback and record paths. Independent gain adjustment is

provided for the two record channels. Sidetone gain adjustment is also provided to set the sidetone level relative to the playback level.

Table 12. Digital Gain Registers

| REGISTER | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 | REGISTER ADDRESS (SEE NOTE) |

MAX9880A

Low-Power, High-Performance Dual I²S Stereo Audio Codec

Line Inputs

The MAX9880A include one pair of single-ended line inputs. When enabled the line inputs connect directly to the headphone amplifier and line outputs and can be optionally connected to the ADC for recording.

Playback Volume

The MAX9880A incorporates volume and mute control to allow level control for the playback audio path. Program registers 0x1C and 0x1D to set the desired volume.

Line Output Level

The MAX9880A incorporates gain and mute control to allow level control for the line outputs.

MAX9880A

Low-Power, High-Performance Dual I²S Stereo Audio Codec

Microphone Inputs

Two differential microphone inputs and a low noise 1.5V microphone bias for powering the microphones are provided by the MAX9880A. In typical applications, the left microphone records a voice signal and the right microphone records a background noise signal. In applications that require only one microphone, use the left microphone input and disable the right ADC. The

microphone signals are amplified by two stages of gain and then routed to the ADCs. The first stage offers selectable 0dB, 20dB, or 30dB settings. The second stage is a programmable gain amplifier (PGA) adjustable from 0dB to 20dB in 1dB steps. Zero-crossing detection is included on the PGA to minimize zipper noise while making gain changes. See Figure 6 for a detailed diagram of the microphone input structure.

ADC

The MAX9880A includes two 18-bit ADCs. The first ADC is used to record left-channel microphone and line-input audio signals. The second ADC can be used to record right-channel microphone and line-input signals or it can be configured to accurately measure DC voltages.

When measuring DC voltages both the left and right ADC must be enabled by setting ADLEN and ADREN in register 0x26. The input to the second ADC is JACKSNS/AUX and the output is reported in AUX (registers 0x02 and 0x03). Since the audio ADC is used to perform the measurement, the digital audio interface must be properly configured. If the left ADC is being used to convert audio, then the DC measurement is performed at the same sample rate. When not using the left ADC, configure the digital interface for a 48kHz sample rate to ensure the fastest possible settling time.

To ensure accurate results, the MAX9880A includes two calibration routines. Calibrate the ADC each time the MAX9880A is powered on. Calibration settings are not lost if the MAX9880A is placed in shutdown. When making a measurement, set AUXCAP to 1 to prevent AUX from changing while reading the registers.

Setup Procedure

- 1) Ensure a valid MCLK signal is provided and configure PSCLK appropriately.
- 2) Choose a clocking mode. The following options are possible:
 - a. **Slave mode with LRCLK and BCLK signals provided.** The measurement sample rate is determined by the external clocks.
 - b. **Slave mode with no LRCLK and BCLK signals provided.** Configure the device for normal clock mode using the NI ratio. Select $f_S = 48\text{kHz}$ to allow for the fastest settling times.
 - c. **Master mode with audio.** Configure the device in normal mode using the NI ratio or exact integer mode using FREQ1 as required by the audio signal.
 - d. **Master mode without audio.** Configure the device in normal mode using the NI ratio. Select $f_S = 48\text{kHz}$ to allow for the fastest settling times.
- 3) Ensure jack sense is disabled.
- 4) Enable the left and right ADC; take the MAX9880A out of shutdown.

MAX9880A

Low-Power, High-Performance Dual I²S Stereo Audio Codec

Offset Calibration Procedure

Perform before the first DC measurement is taken after applying power to the MAX9880A.

- 1) Enable the AUX input (AUXEN = 1).
- 2) Enable the offset calibration (AUXCAL = 1).
- 3) Wait the appropriate time (see Table 17).
- 4) Complete calibration (AUXCAL = 0).

Gain Calibration Procedure

Perform the first time a DC measurement is taken after applying power to the MAX9880A or if the temperature changes significantly.

- 1) Enable the AUX input (AUXEN = 1).
- 2) Start gain calibration (AUXGAIN = 1).
- 3) Wait the appropriate time (see Table 17).
- 4) Freeze the measurement results (AUXCAP = 1).
- 5) Read AUX and store the value in memory to correct all future measurements ($k = \text{AUX}[15:0]$, k is typically 19,500).
- 6) Complete calibration (AUXGAIN = AUXCAP = 0).

DC Measurement Procedure

Perform after offset and gain calibration are complete.

- 1) Enable the AUX input (AUXEN = 1).
 - 2) Wait the appropriate time (see Table 17).
 - 3) Freeze the measurement results (AUXCAP = 1).
 - 4) Read AUX and correct with the gain calibration value
- $$\left(V_{\text{AUX}} = 0.738 \left(\frac{\text{AUX}[15:0]}{k} \right) \right).$$
- 5) Complete measurement (AUXCAP = 0).

Table 17. AUX ADC Wait Times

| LRCLK (kHz) | WAIT TIME (ms) |
|-------------|----------------|
| 48 | 40 |
| 44.1 | 44 |
| 32 | 60 |
| 24 | 80 |
| 22.05 | 90 |
| 16 | 120 |
| 12 | 160 |
| 11.025 | 175 |
| 8 | 240 |

Complete DC Measurement Example

fmclk = 13MHz, slave mode, BCLK, and LRCLK are not externally supplied.

- 1) Configure the digital audio interface for $f_s = 48\text{kHz}$ (PSCLK = 01, FREQ1 = 0x0, PLL = 0, NI = 0x5ABE, MAS = 0).
- 2) Disable jack sense (JDETEN = 0).
- 3) Enable the left and right ADC; take the MAX9880A out of shutdown (ADLEN = ADREN = SHDN = 1).
- 4) Calibrate the offset:
 - a. Enable the AUX input (AUXEN = 1).
 - b. Enable the offset calibration (AUXCAL = 1).
 - c. Wait 40ms.
 - d. Complete calibration (AUXCAL = 0).
- 5) Calibrate the gain:
 - a. Start gain calibration (AUXGAIN = 1).
 - b. Wait 40ms.
 - c. Freeze the measurement results (AUXCAP = 1).
 - d. Read AUX and store the value in memory to correct all future measurements ($k = \text{AUX}[15:0]$).
 - e. Complete calibration (AUXGAIN = AUXCAP = AUXEN = 0).
- 6) Measure the voltage on JACKSNS/AUX.
 - a. Enable the AUX input (AUXEN = 1).
 - b. Wait 40ms.
 - c. Freeze the measurement results (AUXCAP = 1).
 - d. Read AUX and correct with the gain calibration value.
 - e. Complete measurement (AUXCAP = 0).
- 7) DC measurement is complete.

Note: Register addresses listed are for I²C. To get the SPI address, add 0x200 with the following exception: Register 0xFF is not accessible through SPI.

| BITS | FUNCTION |
|-------------|--|
| MXINL/MXINR | Left/Right ADC Audio Input Mixer 00 = No input selected 01 = Left/right analog microphone 10 = Left/right line input 11 = Left/right analog microphone + line input Note: If the right line input is disabled, then the left line input is connected to both mixers. Enabling the left and right digital microphones disables the left and right audio mixer, respectively. See the DIGMICL/DIGMICR bit description for more details. |
| AUXCAP | Auxiliary Input Capture 0 = Update AUX with the voltage at JACKSNS/AUX. 1 = Hold AUX for reading. |
| AUXGAIN | Auxiliary Input Gain Calibration 0 = Normal operation 1 = The input buffer is disconnected from JACKSNS/AUX and connected to an internal voltage reference. While in this mode, read the AUX register and store the value. Use the stored value as a gain calibration factor, k, on subsequent readings. AUXCAL must remain set for time indicated in Table 17 to guarantee an accurate offset calibration. |
| AUXCAL | Auxiliary Input Offset Calibration 0 = Normal operation 1 = JACKSNS/AUX is disconnected from the input and the ADC automatically calibrates out any internal offsets. AUXCAL must remain set for time indicated in Table 17 to guarantee an accurate offset calibration. |
| AUXEN | Auxiliary Input Enable 0 = Use JACKSNS/AUX for jack detection. 1 = Use JACKSNS/AUX for DC measurements. Note: Set MXINR = 00, ADLEN = 1, and ADREN = 1 when AUXEN = 1. |

MAX9880A

Low-Power, High-Performance Dual I²S Stereo Audio Codec

Digital Microphone Input

The MAX9880A can accept audio from up to two digital microphones. When using digital microphones, the left analog microphone input is retasked as a digital

microphone input. The right analog microphone input is still available to allow a combination of analog and digital microphones to be used. Figure 7 shows the digital microphone interface timing diagram.

Low-Power, High-Performance Dual I²S Stereo Audio Codec

Mode Configuration

The MAX9880A includes circuitry to minimize click-and-pop during volume changes, detect headsets, and configure the headphone amplifier mode. Both volume slewing and zero-crossing detection are included to ensure click-and-pop free volume transitions.

Headset Detection Overview

The MAX9880A contains headset detect circuitry that is capable of detecting the insertion or removal of a plug

Table 20. Jack-Detect Registers

| REGISTER | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 | REGISTER ADDRESS | POR STATE | R/W |
|------------------|------------|------|------|----|----|----|-------|----|------------------|-----------|-----|

| Jack Detect | JDETEN | 0 | JDWK | 0 | 0 | 0 | JDEB | — | 0x25 | 0x00 | R/W |

Grayed boxes = Not used.

Jack Configuration Change Flag (JDET)

1 = Jack configuration has changed.

0 = No change in jack configuration.

JDET reports changes in JKSNS[1:0]. Changes to JKSNS[1:0] are debounced before setting JDET. The debounce period is programmable using the JDEB bits. Jack status register 0x01 is a read-only register that reports the status of the jack-detect circuitry when enabled.

Jack Sense (JKSNS)

JKSNS[1:0] reports the status of the JACKSNS pin when JDETEN = 1. JKSNS[1:0] should be interpreted according to Table 21.

Jack-Detect Interrupt Enable (IJDET)

Hardware interrupts are reported on the open-drain $\overline{\text{IRQ}}$ pin. When an interrupt occurs, $\overline{\text{IRQ}}$ remains low until the interrupt is serviced by reading the status register 0x00. If a flag is set, it is reported as a hardware interrupt only if the corresponding interrupt enable is set. Each bit enables interrupts for the status flag in the respective bit location in register 0x00. So IJDET must be set to enable interrupts for jack detect.

Jack-Detect Enable (JDETEN)

Enables the jack-detect circuitry.

Jack-Sense Weak Pullup (JDWK)

Enables a weak internal pullup current for reduced power loss when the chip is in shutdown or the MICBIAS is disabled.

JDWK = 0 enables a $2.2k\Omega$ pullup to obtain full jack-detect operation. This mode can be used to detect insertion and removal of a plug as well as distinguish between headphone and headset accessories.

JDWK = 1 enables a $4\mu\text{A}$ pullup current source when SHDN = 0 or MICBIAS disabled. In this power-saving configuration, the circuit can detect insertion and removal of a plug but cannot distinguish between headphone and headset accessories.

The recommended usage follows: Set JDWK = 0 (or set any bit in the microphone preamplifier gain registers PALEN[1:0] or PAREN[1:0]). This enables the $2.2k\Omega$ pullup. Once the jack has been inserted and the type of accessory determined, set JDWK = 1 to save power. Once the plug is removed, set JDWK = 0.

Table 21. Jack Sense (JKSNS)

| JKSNS[1:0] | DESCRIPTION |
|------------|---|
| 00 | JACKSNS is below V_{TH2} (low). |
| 01 | JACKSNS is between V_{TH1} and V_{TH2} (mid). |
| 10 | Invalid. |
| 11 | JACKSNS is above V_{TH1} (high). |

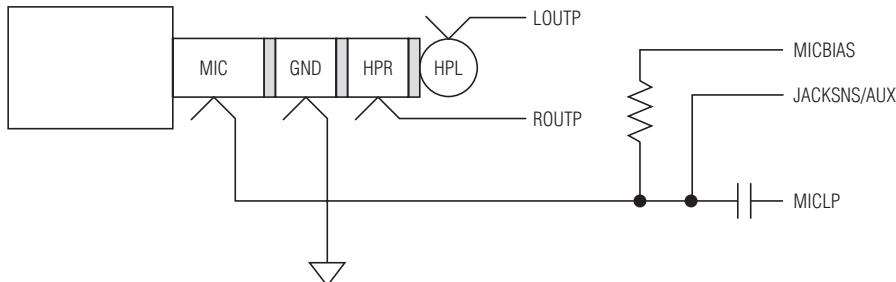

Figure 8. Typical Configuration for Headset Detection

Table 22. Debounce Time

| JDEB | DEBOUNCE (ms) |
|------|---------------|
| 00 | 25 |
| 01 | 50 |
| 10 | 100 |
| 11 | 200 |

Debounce (JDEB)

Configures the JDET debounce time for changes to JKSNS[1:0] according to Table 22.

For jack plug insertion/removal, the sequence of events is as follows:

Jack insertion: No jack is present. The MAX9880A has a power supply and is in low-power sleep mode (LOUTP/ROUTP are high impedance). When the JDETEN I²C bit is set, the JACKSNS pin has weak pullups to MICVDD. When a jack is subsequently inserted, JACKSNS should change state (indicated by I²C bits JKSNS[1:0]), and this causes the IRQ pin to be pulled low, which can trigger a system wakeup.

Jack present: After an interrupt has been sent to the system controller, the I²C must indicate unambiguously that a jack is present when the I²C registers are read. This is done with the JDET I²C bit, which goes high when there is a change of state of the JKSNS[1:0] bits. The MAX9880A jack-detect system monitors the JACKSNS pin and reports the voltage level as high

($> 95\% \times \text{MICBIAS}$), mid, or low ($< 10\% \times \text{MICBIAS}$). When connected to the microphone pin of the headset jack, this window comparator allows detection of:

- No headset (high)
- Cellular headset with microphone (high \rightarrow mid)
- Stereo headset without microphone (high \rightarrow low)
- Cellular headset button press (mid \rightarrow low \rightarrow mid)
- Headset removal (low or mid \rightarrow high)

Jack removal: A jack is present. All output poles (headphones/line outs) are assumed driven by a low impedance amplifier. All input poles (microphones) are assumed to be biased with a voltage above ground but below 95% of the MICBIAS voltage. For the MAX9880A to sense when a jack is removed, the JACKSNS pin must be connected to the jack in such a way as to ensure either the JACKSNS pin gets pulled above 95% of MICBIAS (as would happen if JACKSNS is hooked to a microphone pole) or it changes state from low to high or vice versa (as would happen if JACKSNS is hooked to a ground pole which goes high impedance when the jack is removed, or is hooked to a regular jack insertion tab that shorts to ground when the jack is removed). Subsequently, IRQ is pulled low.

Jack absent: After an interrupt has been sent to the system controller, the I²C must indicate unambiguously that a jack is **not** present when the I²C registers are read. This is indicated by reading the status of the JKSNS[1:0] I²C read bits.

Note: JDETEN = 1; MICBIAS enable; any bit of PALEN/PAREN set.

MAX9880A

Low-Power, High-Performance Dual I²S Stereo Audio Codec

Headphone Modes

The MAX9880A's headphone amplifier supports differential, single-ended, and capacitorless output modes, as shown in Figure 9. In each mode, the amplifier can be configured for stereo or mono operation. The single-

ended mode optionally includes click-and-pop reduction to eliminate the click-and-pop that would normally be caused by the output coupling capacitor. When click-and-pop reduction is not required leave LOUTN and ROUTN unconnected.

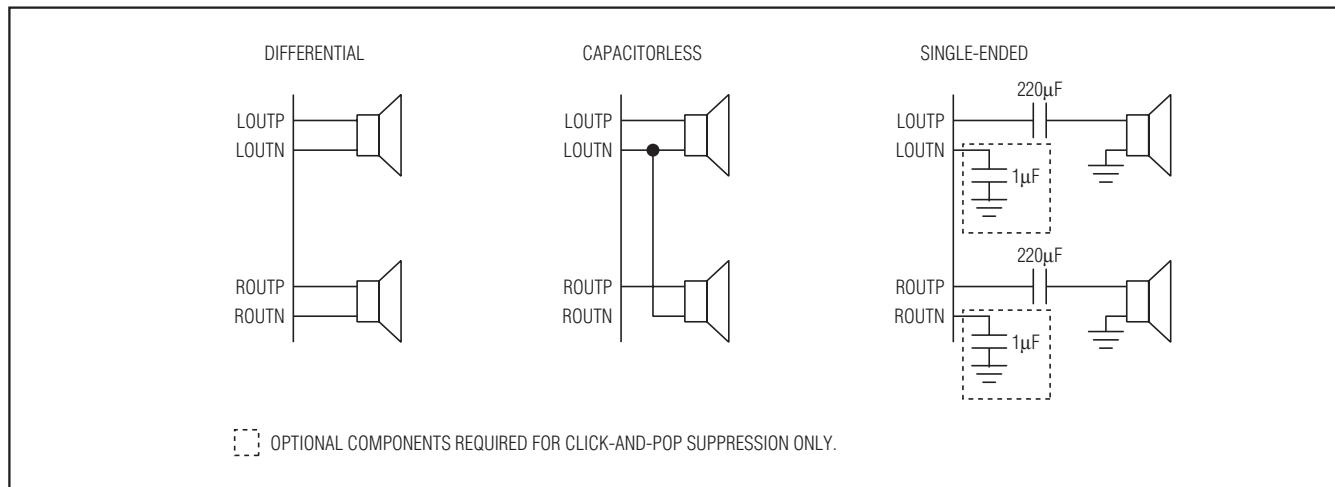

Figure 9. Headphone Amplifier Modes

Power Management

The MAX9880A includes complete power management control to minimize power usage. The DAC and both ADCs can be independently enabled so that only the required circuitry is active.

Revision Code

The MAX9880A includes a revision code to allow easy identification of the device revision. Revision code at register address 0xFF is not accessible through the SPI interface and so the revision code is accessible through SPI at an additional address of 0x214. The current revision code is 0x42.

Low-Power, High-Performance Dual I²S Stereo Audio Codec

Table 25. Power Management Register

| REGISTER | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 | REGISTER ADDRESS (SEE NOTE) |
|-----------------|-------|-------|-------|-------|-------|-------|-------|-------|-----------------------------|
| Enable | LNLEN | LNREN | LOLEN | LOREN | DALEN | DAREN | ADLEN | ADREN | 0x26 |
| System Shutdown | SHDN | 0 | 0 | 0 | XTEN | XTOSC | 0 | 0 | 0x27 |

Grayed boxes = Not used.

Note: Register addresses listed are for I²C. To get the SPI address, add 0x200 with the following exception: Register 0xFF is not accessible through SPI.

| BITS | FUNCTION |
|-------|--|
| LNLEN | Left-Line Input Enable. Enables the left-line input preamp and automatically enables the left and right headphone amplifiers. If LNREN = 0, the left-line input signal is also routed to the right ADC input mixer and right headphone amplifier. Note: Control of the right headphone amplifier can be overridden by HPMODE. |
| LNREN | Right-Line Input Enable. Enables the right-line input preamp and automatically enables the right headphone amplifiers. Note: Control of the right headphone amplifier can be overridden by HPMODE. |
| LOLEN | Left-Line Output Enable. Enables the left-line output. |
| LOREN | Right-Line Output Enable. Enables the right-line output. |
| DALEN | Left DAC Enable. Enables the left DAC and automatically enables the left and right headphone amplifiers. If DAREN = 0, the left DAC signal is also routed to the right headphone amplifier. Note: Control of the right headphone amplifier can be overridden by HPMODE. |
| DAREN | Right DAC Enable. Enables the right DAC. Right DAC operation requires DALEN = 1. |
| ADLEN | Left ADC Enable. |
| ADREN | Right ADC Enable. Enabling the right ADC must be done in the same I ² C write operation that enables the left ADC. The right ADC can be enabled while the left ADC is running if used for DC measurements. SHDN must be toggled to disable the right ADC in this case. Right ADC operation requires ADLEN = 1. |
| SHDN | Shutdown. Places the device in low power shutdown mode. |
| XTEN | Crystal Clock Enable 1 = Output of crystal oscillator and buffer routed to the clock prescaler. MCLK input disabled. 0 = MCLK input routed to the clock prescaler. Crystal oscillator and buffer disabled. |
| XTOSC | Crystal Clock Source 1 = Disables the internal crystal oscillator. Provide an external clock on X1. 0 = Enables the internal crystal oscillator. Attach a crystal between X1 and X2. XTOSC is ignored if XTEN = 0. |

Table 26. Revision Code Register

Low-Power, High-Performance Dual I²S Stereo Audio Codec

MAX9880A

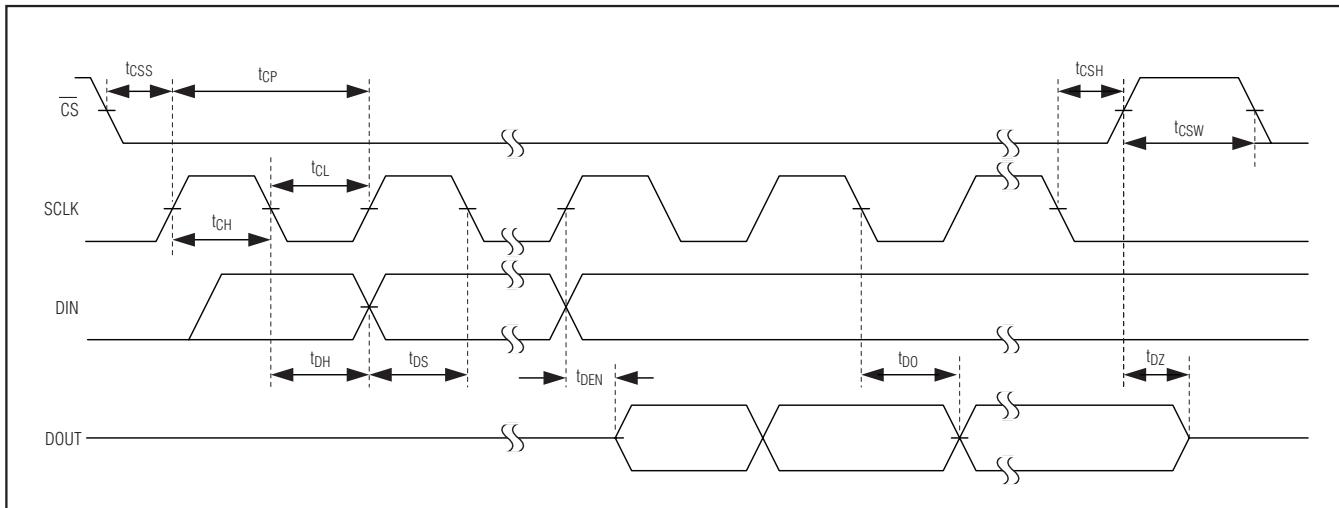

Figure 10. SPI Interface Timing Diagram

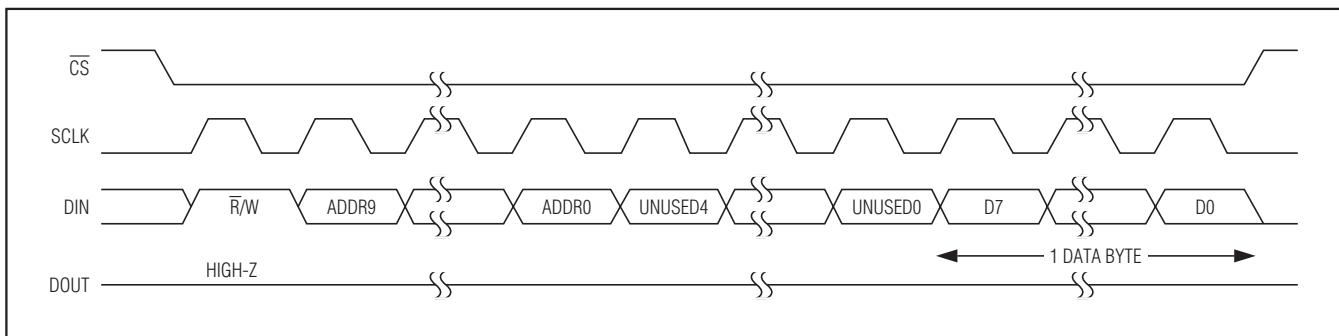

Figure 11. Writing 1 Byte of Data to the MAX9880A

Serial Peripheral Interface (SPI)

Chip Select (\overline{CS})

The MAX9880A SPI interface is active only when \overline{CS} is low. When \overline{CS} is high, the MAX9880A configures the DOUT output for high impedance and resets the internal SPI logic. If \overline{CS} goes high in the middle of an SPI transfer, all the data is discarded. When \overline{CS} is low, unless the register address is correctly decoded by the MAX9880A, the DOUT output is high impedance.

Serial Clock (SCLK)

The SPI master provides the SCLK signal to clock the SPI interface. SCLK has an upper frequency limit of 25MHz. The MAX9880A samples the DIN input data on the falling edge of SCLK and changes the output data on the rising edge of SCLK. The MAX9880A ignores SCLK transitions when \overline{CS} is high.

Serial-Data In (DIN) and Serial-Data Out (DOUT)

The SPI frame is organized into 24 bits. The first 16 bits consist of the R/W enable bit, followed by the 10 register address bits and 5 unused bits. The next 8 bits are data bits, sent most significant bit first.

For an SPI write transfer, write a 1 to the R/W bit, followed by the 10 register address bits, 5 unused bits, then the 8 data bits.

Figure 11 illustrates the proper frame format for writing one byte of data to the MAX9880A. Additional 24-bit frames can be sent while \overline{CS} remains low. The DOUT output is high impedance during a write operation.

For an SPI read transfer, write a zero to the R/W bit, followed by the 10 register address bits and 5 unused bits. Any data sent after the register address bits are ignored. The internal contents of the register being read

Low-Power, High-Performance Dual I²S Stereo Audio Codec

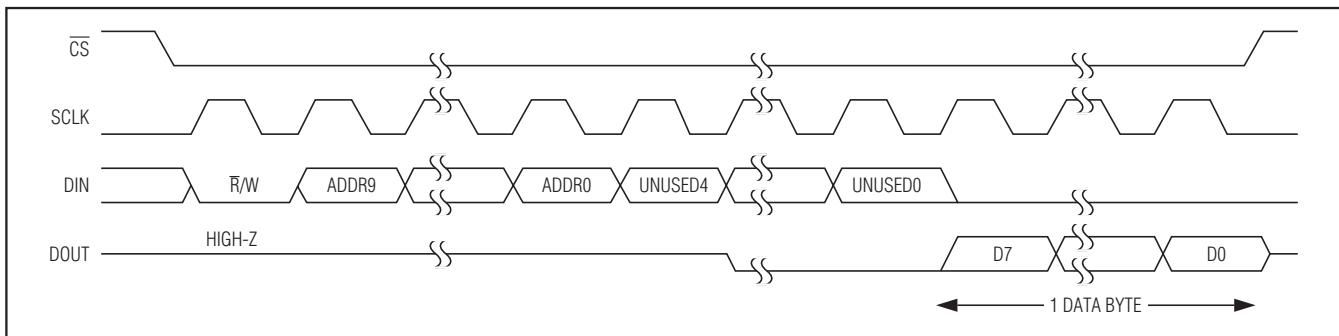

Figure 12. Reading 1 Byte of Data from the MAX9880A

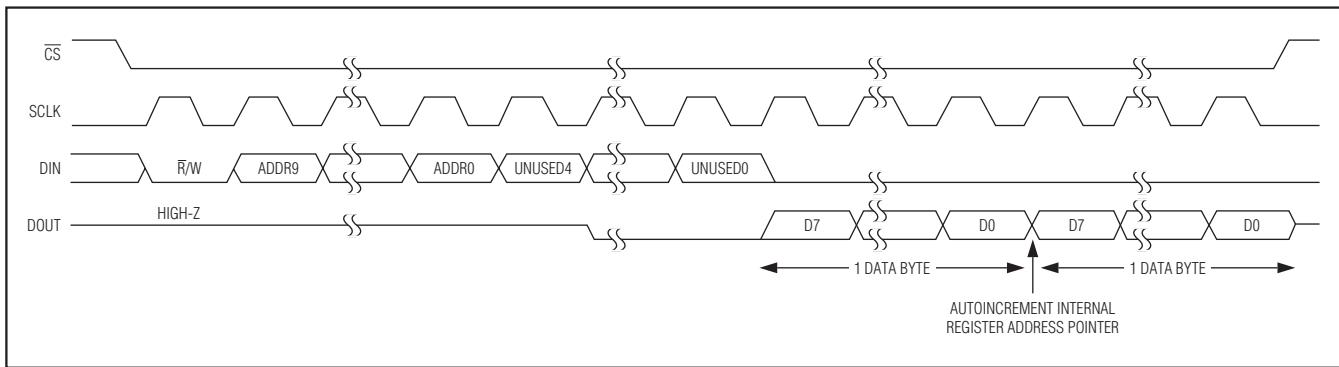

Figure 13. Reading n Bytes of Data from the MAX9880A

do not change until the transfer is complete. The DOUT output is high impedance when writing the register address bits. If the correct register address is decoded, DOUT is driven low at the first rising clock edge after the first unused bit.

Figure 12 illustrates the proper frame format for reading 1 byte of data from the MAX9880A.

When reading data from the MAX9880A, the address pointer autoincrements by one register address if CS is held low after reading the first 8 data bits. For each subsequent eight clock cycles, a byte of data is read. This autoincrement feature allows a master to read sequential registers within one continuous SPI register address range from 0x200 to 0x227. The register address does not autoincrement if a read is initiated at a register address lower than 0x200. If the register address increments beyond 0x227, the DOUT output is high impedance. Figure 13 illustrates the proper format for reading multiple bytes of data.

I²C Serial Interface

The MAX9880A features an I²C/SMBus™-compatible, 2-wire serial interface consisting of a serial-data line (SDA) and a serial-clock line (SCL). SDA and SCL facilitate communication between the MAX9880A and the master at clock rates up to 400kHz. Figure 14 shows the 2-wire interface timing diagram. The master generates SCL and initiates data transfer on the bus. The master device writes data to the MAX9880A by transmitting the proper slave address followed by the register address and then the data word. Each transmit sequence is framed by a START (S) or repeated START (Sr) condition and a STOP (P) condition. Each word transmitted to the MAX9880A is 8 bits long and is followed by an acknowledge clock pulse. A master reading data from the MAX9880A transmits the proper slave address followed by a series of nine SCL pulses. The MAX9880A transmits data on SDA in sync with the master-generated SCL pulses. The master acknowledges receipt of each byte of data. Each read

SMBus is a trademark of Intel Corp.

Low-Power, High-Performance Dual I²S Stereo Audio Codec

MAX9880A

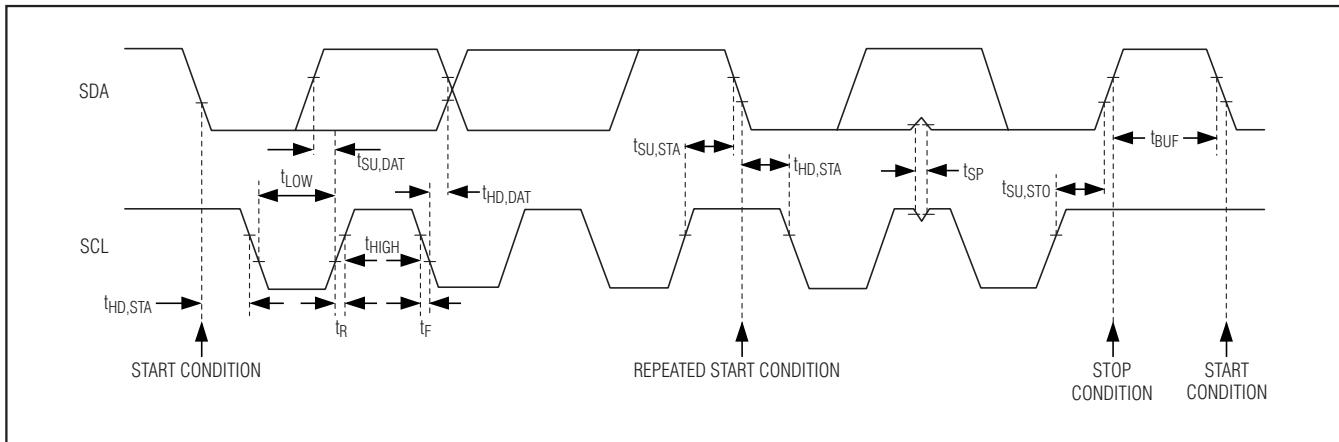

Figure 14. 2-Wire Interface Timing Diagram

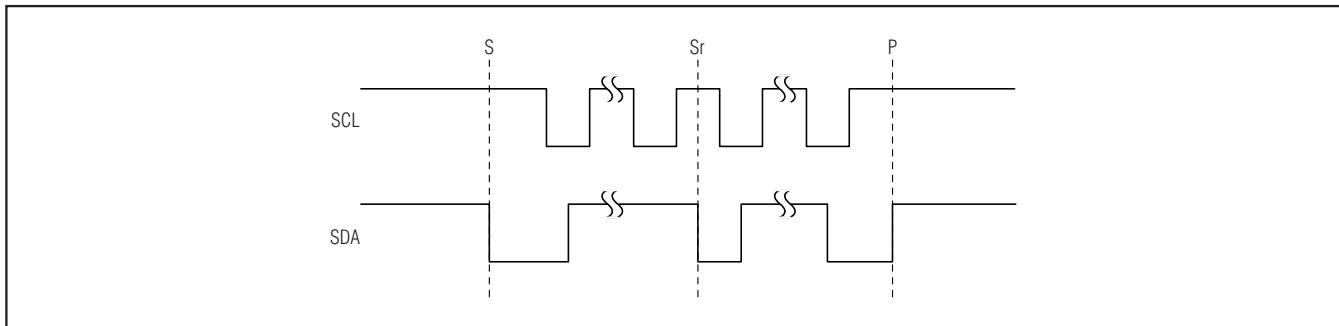

Figure 15. START, STOP, and Repeated START Conditions

sequence is framed by a START or repeated START condition, a not acknowledge, and a STOP condition. SDA operates as both an input and an open-drain output. A pullup resistor, typically greater than 500Ω , is required on SDA. SCL operates only as an input. A pullup resistor, typically greater than 500Ω , is required on SCL if there are multiple masters on the bus, or if the single master has an open-drain SCL output. Series resistors in line with SDA and SCL are optional. Series resistors protect the digital inputs of the MAX9880A from high voltage spikes on the bus lines and minimize crosstalk and undershoot of the bus signals.

Bit Transfer

One data bit is transferred during each SCL cycle. The data on SDA must remain stable during the high period of the SCL pulse. Changes in SDA while SCL is high are control signals (see the *START and STOP Conditions* section).

START and STOP Conditions

SDA and SCL idle high when the bus is not in use. A master initiates communication by issuing a START condition. A START condition is a high-to-low transition on SDA with SCL high. A STOP condition is a low-to-high transition on SDA while SCL is high (Figure 15). A START condition from the master signals the beginning of a transmission to the MAX9880A. The master terminates transmission and frees the bus by issuing a STOP condition. The bus remains active if a repeated START condition is generated instead of a STOP condition.

Early STOP Conditions

The MAX9880A recognizes a STOP condition at any point during data transmission except if the STOP condition occurs in the same high pulse as a START condition. For proper operation, do not send a STOP condition during the same SCL high pulse as the START condition.

Low-Power, High-Performance Dual I²S Stereo Audio Codec

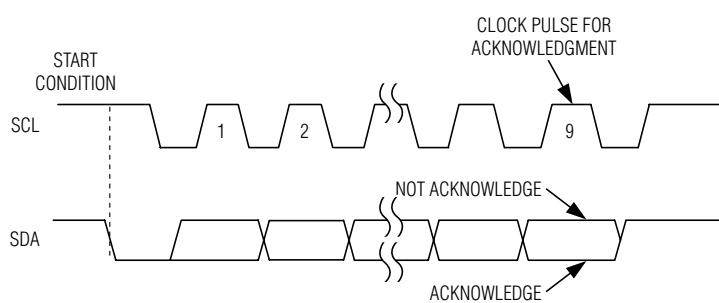

Figure 16. Acknowledge

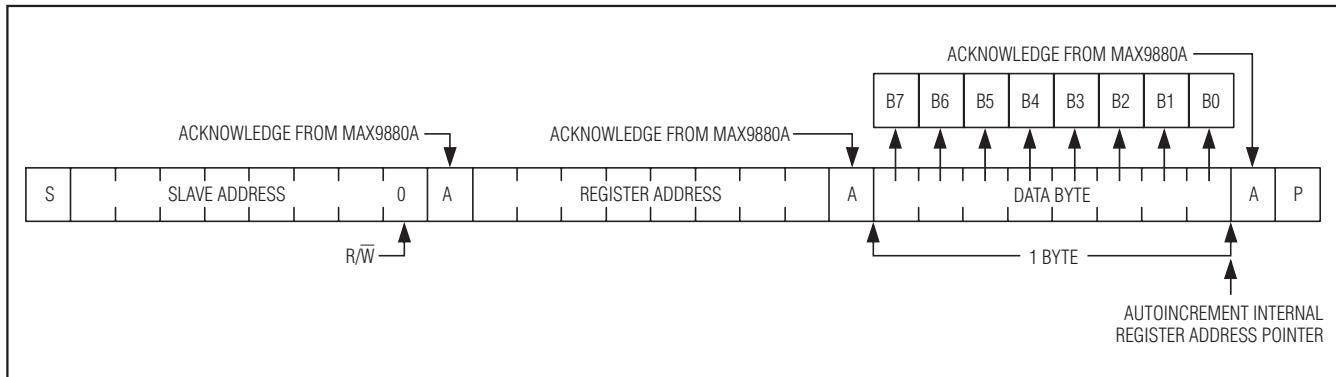

Figure 17. Writing 1 Byte of Data

Slave Address

The slave address is defined as the seven most significant bits (MSBs) followed by the read/write bit. For the MAX9880A, the seven most significant bits are 0010000. Setting the read/write bit to 1 (slave address = 0x21) configures the MAX9880A for read mode. Setting the read/write bit to 0 (slave address = 0x20) configures the MAX9880A for write mode. The address is the first byte of information sent to the MAX9880A after the START condition.

Acknowledge

The acknowledge bit (ACK) is a clocked 9th bit that the MAX9880A uses to handshake receipt each byte of data when in write mode (see Figure 16). The MAX9880A pulls down SDA during the entire master-generated 9th clock pulse if the previous byte is successfully received. Monitoring ACK allows for detection of unsuccessful data transfers. An unsuccessful data transfer occurs if a receiving device is busy or if a system fault has occurred. In the event of an unsuccessful data transfer, the bus master retries communication.

The master pulls down SDA during the 9th clock cycle to acknowledge receipt of data when the MAX9880A is in read mode. An acknowledge is sent by the master after each read byte to allow data transfer to continue. A not acknowledge is sent when the master reads the final byte of data from the MAX9880A, followed by a STOP condition.

Write Data Format

A write to the MAX9880A includes transmission of a START condition, the slave address with the R/W bit set to 0, 1 byte of data to configure the internal register address pointer, 1 or more bytes of data, and a STOP condition. Figure 17 illustrates the proper frame format for writing 1 byte of data to the MAX9880A. Figure 18 illustrates the frame format for writing n bytes of data to the MAX9880A.

The slave address with the R/W bit set to 0 indicates that the master intends to write data to the MAX9880A. The MAX9880A acknowledges receipt of the address byte during the master-generated 9th SCL pulse.

Low-Power, High-Performance Dual I²S Stereo Audio Codec

The second byte transmitted from the master configures the MAX9880A's internal register address pointer. The pointer tells the MAX9880A where to write the next byte of data. An acknowledge pulse is sent by the MAX9880A upon receipt of the address pointer data.

The third byte sent to the MAX9880A contains the data that is written to the chosen register. An acknowledge pulse from the MAX9880A signals receipt of the data byte. The address pointer autoincrements to the next register address after each received data byte. This autoincrement feature allows a master to write to sequential registers within one continuous frame. The master signals the end of transmission by issuing a STOP condition. Register addresses greater than 0x17 are reserved. Do not write to these addresses.

Read Data Format

Send the slave address with the R/W bit set to 1 to initiate a read operation. The MAX9880A acknowledges receipt of its slave address by pulling SDA low during the 9th SCL clock pulse. A START command followed by a read command resets the address pointer to register 0x00.

The first byte transmitted from the MAX9880A is the contents of register 0x00. Transmitted data is valid on

the rising edge of SCL. The address pointer autoincrements after each read data byte. This autoincrement feature allows all registers to be read sequentially within one continuous frame. A STOP condition can be issued after any number of read data bytes. If a STOP condition is issued followed by another read operation, the first data byte to be read is from register 0x00.

The address pointer can be preset to a specific register before a read command is issued. The master presets the address pointer by first sending the MAX9880A's slave address with the R/W bit set to 0 followed by the register address. A repeated START condition is then sent followed by the slave address with the R/W bit set to 1. The MAX9880A then transmits the contents of the specified register. The address pointer autoincrements after transmitting the first byte.

The master acknowledges receipt of each read byte during the acknowledge clock pulse. The master must acknowledge all correctly received bytes except the last byte. The final byte must be followed by a not acknowledge from the master and then a STOP condition. Figure 19 illustrates the frame format for reading 1 byte from the MAX9880A. Figure 20 illustrates the frame format for reading multiple bytes from the MAX9880A.

Applications Information

Proper layout and grounding are essential for optimum performance. When designing a PCB for the MAX9880A, partition the circuitry so that the analog sections of the MAX9880A are separated from the digital sections. This ensures that the analog audio traces are not routed near digital traces.

Use a large continuous ground plane on a dedicated layer of the PCB to minimize loop areas. Connect AGND and DGND directly to the ground plane using the shortest trace length possible. Proper grounding improves audio performance, minimizes crosstalk between channels, and prevents any digital noise from coupling into the analog audio signals.

Ground the bypass capacitors on MICBIAS, REG, PREG, and REF directly to the ground plane with minimum trace length. Also be sure to minimize the path length to AGND. Bypass AVDD directly to AGND.

Connect all digital I/O termination to the ground plane with minimum path length to DGND. Bypass DVDD and DVDDS1 directly to DGND.

Route microphone signals from the microphone to the MAX9880A as a differential pair, ensuring that the positive and negative signals follow the same path as closely as possible with equal trace length. When using single-ended microphones or other single-ended audio sources, ground the negative microphone input as close to the audio source as possible and then treat the positive and negative traces as differential pairs.

The MAX9880A TQFN package features an exposed thermal pad on its underside. Connect the exposed thermal pad to AGND.

An evaluation kit (EV kit) is available to provide an example layout for the MAX9880A. The EV kit allows quick setup of the MAX9880A and includes easy-to-use software allowing all internal registers to be controlled.

Startup Sequences

Table 27. Clock Initialization (Perform Before Any Playback or Record Setup)

| SEQUENCE | DESCRIPTION | REGISTERS |
|----------|-----------------------------------|------------------------------------|
| 1 | SHDN = 0 | 0x27 |
| 2 | Configure clocks | 0x05, 0x06, 0x07, 0x0B, 0x0C |
| 3 | Configure digital audio interface | 0x08, 0x09, 0x0A, 0x0D, 0x0E, 0x0F |

Table 28. Music Playback

| SEQUENCE | DESCRIPTION | REGISTERS |
|----------|--|------------|
| 1 | Select DAC audio source | 0x10 |
| 2 | Select music filters | 0x11 |
| 3 | Set output volume | 0x1C, 0x1D |
| 4 | Set line output volume | 0x1E, 0x1F |
| 5 | Select headphone mode | 0x24 |
| 6 | Enable line outputs and DAC as required | 0x26 |
| 7 | Enable LRCLK and BCLK (if operating in slave mode) | N/A |
| 8 | Enable MAX9880A | 0x27 |
| 9 | Enable external amplifier (if using) | N/A |

Low-Power, High-Performance Dual I²S Stereo Audio Codec

Example of Register Settings for Music Playback and Voice Duplex Scenarios

Music Playback

fMCLK = 12.288MHz (master clock supplied to codec), fLRCLK = 48kHz, standard I²S format, codec in slave

mode, music source connected through S2 pins to DAI2 audio path, and output on headphone amplifiers (output capacitorless mode).

Table 34. Music Playback

| SEQUENCE | DESCRIPTION | REGISTER ADDRESS | REGISTER VALUE |
|----------|---|------------------|----------------|
| 1 | SHDN = 0 | 0x27 | 04h |
| 2 | Configure system clock | 0x05 | 10h |
| 3 | Configure DAI2 clock | 0x0B | 60h |
| 4 | Configure DAI2 clock | 0x0C | 00h |
| 5 | Configure DAI2 audio path | 0x0D | 11h |
| 6 | Configure DAI2 audio path | 0x0E | 50h |
| 7 | Select DAC audio source | 0x10 | 21h |
| 8 | Select music filters | 0x11 | 80h |
| 9 | Set output volume (0dB) | 0x1C, 0x1D | 09h |
| 10 | Set line output volume (muted) | 0x1E, 0x1F | 40h |
| 11 | Select headphone mode (output capacitorless mode) | 0x24 | 02h |
| 12 | Enable line outputs and DAC as required | 0x26 | 0Ch |
| 13 | Enable MAX9880A | 0x27 | 84h |

Voice Duplex

fMCLK = 13MHz (master clock supplied to codec), fLRCLK = 8kHz, TDM/PCM format, codec in slave

mode, voice signals on S1 pins to DAI1 audio path and output on headphone amplifier left (differential mode).

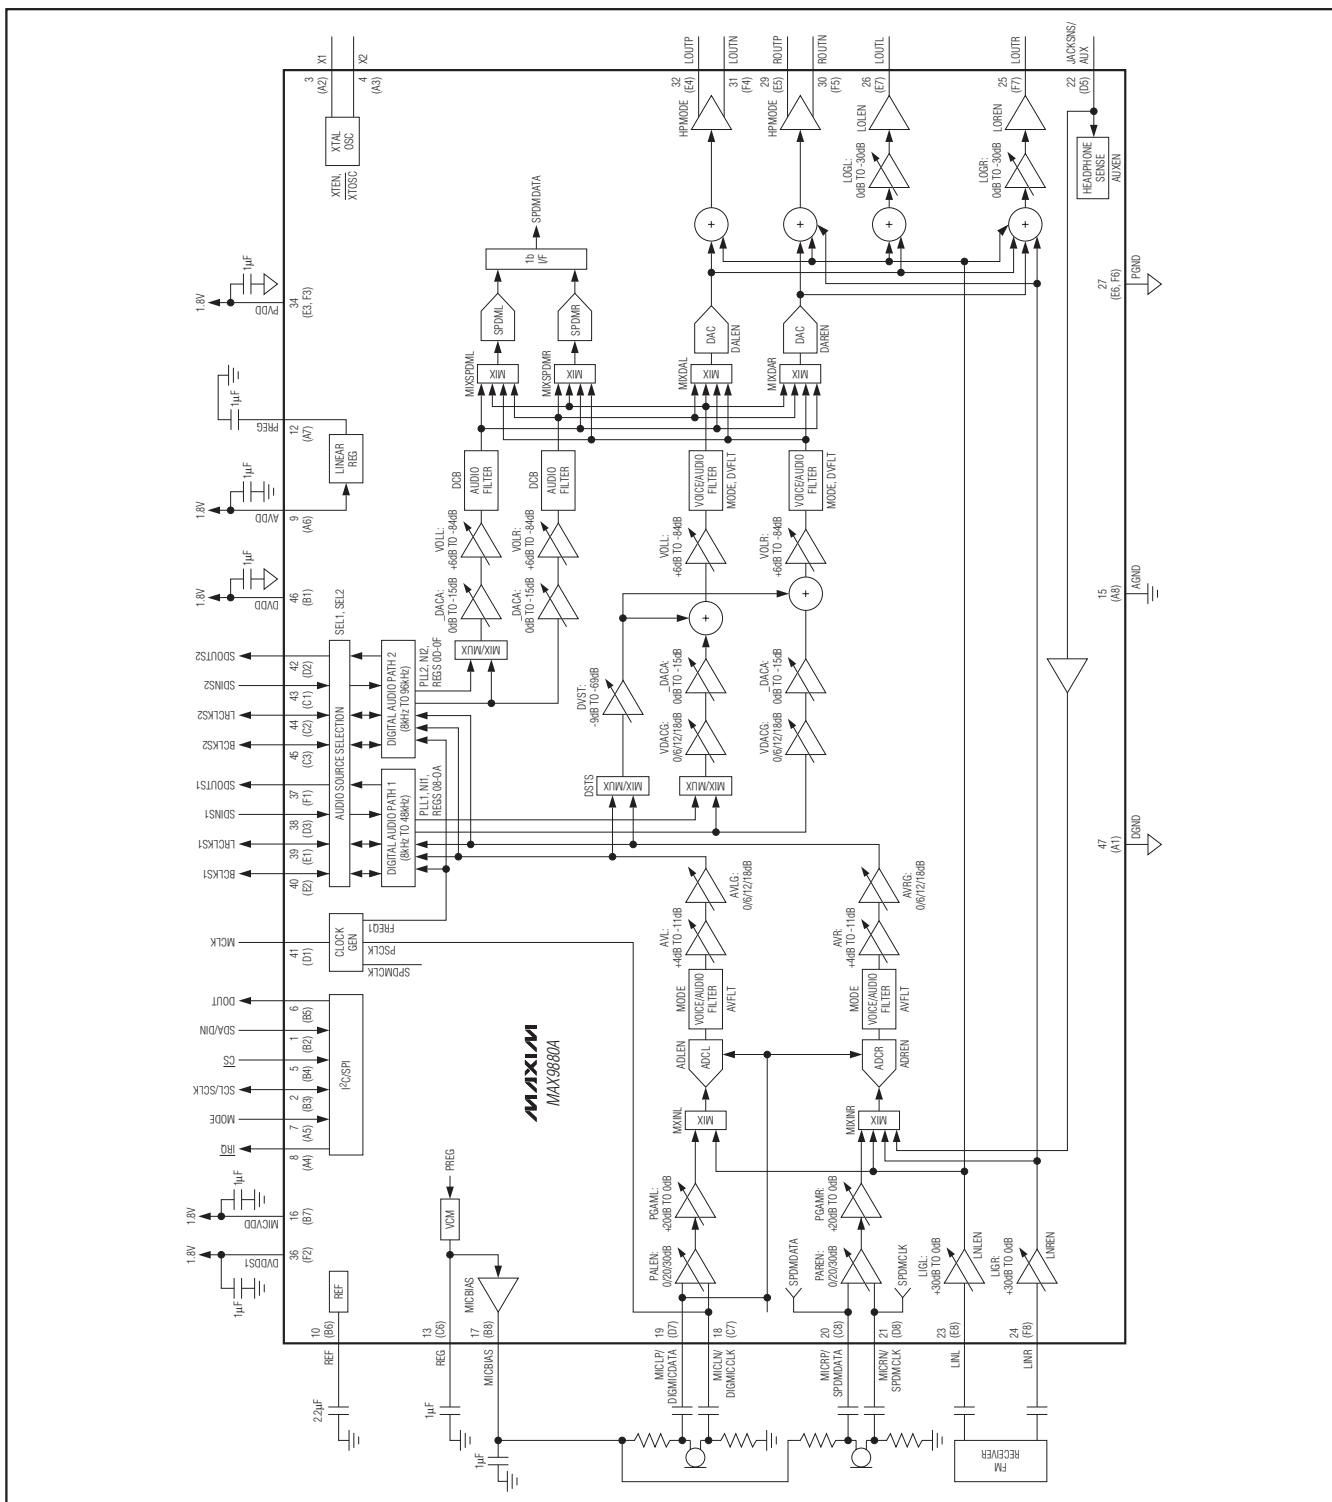

Table 35. Voice Duplex

| SEQUENCE | DESCRIPTION | REGISTER ADDRESS | REGISTER VALUE |
|----------|--|------------------|----------------|
| 1 | SHDN = 0 | 0x27 | 04h |
| 2 | Configure system clock | 0x05 | 10h |
| 3 | Configure DAI1 clock | 0x0B | 0Fh |
| 4 | Configure DAI1 clock | 0x0C | 1Fh |
| 5 | Configure DAI1 audio path | 0x0D | 04h |
| 6 | Configure DAI2 audio path | 0x0E | 30h |
| 7 | Select DAC audio source | 0x10 | 21h |
| 8 | Select voice GSM filters | 0x11 | 33h |
| 9 | Set ADC level to 0dB | 0x18, 0x19 | 03h |
| 10 | Configure microphone gain (20dB preamp gain) | 0x20, 0x21 | 54h |
| 11 | Set headphone volume | 0x1C, 0x1D | 09h |
| 12 | Set line output volume (if using) | 0x1E, 0x1F | 40h |
| 13 | Configure ADC input mixer | 0x22 | 50h |
| 14 | Configure MICBIAS voltage (2.2V) | 0x23 | 01h |
| 15 | Select headphone mode | 0x24 | 01h |

NOTES:

1. ALL DIMENSIONS ARE IN MILLIMETERS, ANGLES IN DEGREES UNLESS OTHERWISE SPECIFIED
2. DIMENSIONING & TOLERANCING CONFORM TO ASME Y14.5M-1994.
3. MATERIAL MUST COMPLY WITH BANNED AND RESTRICTED SUBSTANCES SPEC # 10-0131.
4. THE TERMINAL #1 IDENTIFIER AND TERMINAL NUMBERING CONVENTION SHALL CONFORM TO JESD 95-1 SPP-012. DETAILS OF TERMINAL #1 IDENTIFIER ARE OPTIONAL, BUT MUST BE LOCATED WITHIN THE ZONE INDICATED. THE TERMINAL #1 IDENTIFIER MAY BE EITHER A MOLD OR MARKED FEATURE.
5. DIMENSION b APPLIES TO METALLIZED TERMINAL AND IS MEASURED BETWEEN 0.25mm AND 0.30mm FROM TERMINAL TIP.
6. ND AND NE REFER TO THE NUMBER OF TERMINALS ON EACH D AND E SIDE, RESPECTIVELY.
7. COPLANARITY APPLIES TO THE EXPOSED HEAT SINK SLUG AS WELL AS THE TERMINALS.
8. DRAWING CONFORMS TO JEDEC MO220, EXCEPT FOR 0.4mm LEAD PITCH: PACKAGE T4866.
9. N IS THE TOTAL NUMBER OF TERMINALS.
10. WARPAGE SHALL NOT EXCEED 0.10mm.
11. MARKING IS FOR PACKAGE ORIENTATION PURPOSE ONLY.
12. NUMBER OF LEADS SHOWN FOR REFERENCE ONLY.
13. ALL DIMENSIONS APPLY TO BOTH LEADED (-) AND PbFREE (+) PKG. CODES.
