

MC10SX1189

Fibre Channel Coaxial Cable Driver and Loop Resiliency Circuit

Description

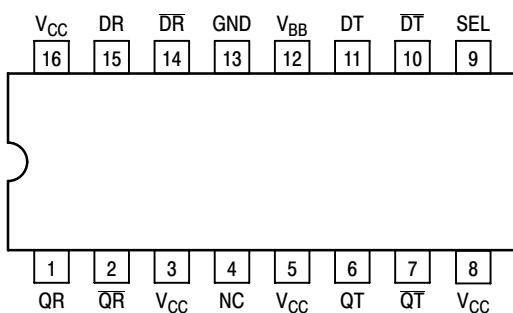

The MC10SX1189 is a differential receiver, differential transmitter specifically designed to drive coaxial cables. It incorporates the output cable drive capability of the MC10EL89 Coaxial Cable Driver with additional circuitry to multiplex the output cable drive source between the cable receiver or the local transmitter inputs. The multiplexer control circuitry is TTL compatible for ease of operation.

The MC10SX1189 is useful as a bypass element for Fibre Channel-Arbitrated Loop (FC-AL) or Serial Storage Architecture (SSA) applications, to create loop style interconnects with fault tolerant, active switches at each device node. This device is particularly useful for back panel applications where small size is desirable.

The EL89 style drive circuitry produces swings twice as large as a standard PECL output. When driving a coaxial cable, proper termination is required at both ends of the line to minimize reflections. The 1.6 V output swings allow for proper termination at both ends of the cable, while maintaining the required swing at the receiving end of the cable. Because of the larger output swings, the QT, \overline{QT} outputs are terminated into the thevenin equivalent of 50Ω to $V_{CC} - 3.0\text{ V}$ instead of 50Ω to $V_{CC} - 2.0\text{ V}$.

Features

- 425 ps Propagation Delay
- 1.6 V Output Swing on the Cable Driving Output
- Operation Range: $V_{CC} = 4.5\text{ V}$ to 5.5 V
- $75\text{ k}\Omega$ Internal Input Pull Down Resistors
- $>1000\text{ V}$ ESD Protection
- Transistor Count = 102
- Pb-Free Packages are Available*

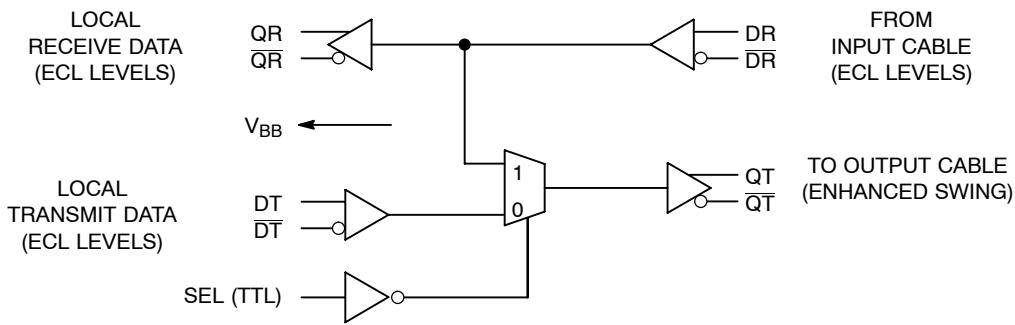

Figure 2. LOGIC DIAGRAM

Table 1. ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
V _{CC}	Power Supply Voltage (Referenced to GND)	0 to +7.0	Vdc
V _{IN}	Input Voltage (Referenced to GND)	0 to +6.0	Vdc
I _{OUT}	Output Current Continuous Surge	50 100	mA
T _A	Operating Temperature Range	-40 to +85	°C
T _{STG}	Storage Temperature Range	-50 to +150	°C

Maximum ratings are those values beyond which device damage can occur. Maximum ratings applied to the device are individual stress limit values (not normal operating conditions) and are not valid simultaneously. If these limits are exceeded, device functional operation is not implied, damage may occur and reliability may be affected.

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfpm. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

1. Values will track 1:1 with the V_{CC} supply. V_{EE} can vary +0.5 V to -0.5 V.
2. Outputs loaded with 50 Ω to V_{CC} – 2.0 V.
3. Outputs loaded with 50 Ω to V_{CC} – 3.0 V.
4. Outputs open circuited.

Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

5. V_{EE} can vary +0.5 V to -0.5 V.
6. The differential propagation delay is defined as the delay from the crossing points of the differential input signals to the crossing point of the differential output signals.
7. The single-ended propagation delay is defined as the delay from the 50% point of the input signal to the 50% point of the output signal.
8. Duty cycle skew is the difference between t_{PLH} and t_{PHL} propagation delay through a device.
9. Minimum input swing for which AC parameters are guaranteed.
10. The CMR range is referenced to the most positive side of the differential input signal. Normal operation is obtained if the HIGH level falls within the specified range and the peak-to-peak voltage lies between $V_{PP\ Min}$ and 1.0 V.
