

LTC2983DSM

LTC2983 Demo Software Manual

### DESCRIPTION

The LTC<sup>®</sup>2983 demo software is designed to help configure, program and run the LTC2983. It can configure the LTC2983, save the configuration, check for configuration errors, run the LTC2983, output the conversion results into a text file, and create Linduino-ready C code based on the configuration. The software can be used by itself, or used in conjunction with the DC2209 demo circuit.

The software can be used by itself, or used in conjunction with the DC2209 demo circuit. For more information about this circuit, please see http://www.linear.com/demo/DC2296

### INSTALLING THE PROGRAM

The LTC2983 demo software can be installed either through QuikEval™ or manually.

QuikEval provides a single interface that installs and launches the appropriate Linear Technology demo software based on the hardware connected to the computer. However, QuikEval requires connected demo hardware (DC2209) to install or run.

A manual install and/or launch, by contrast, works with or without any of the accompanying demo hardware.

To install through QuikEval, follow the steps below:

- 1. Obtain the DC2209 demo circuit, one sensor-specific demo circuit (DC2210, DC2211, DC2212, DC2213 or DC2214), and a DC2026 Linduino demo board.
- 2. Before connecting the hardware to the computer, install the latest version of the QuikEval software. This can be downloaded at www.linear.com/software.
- 3. Connect the hardware together. Connect the DC2209 to the DC2026 using the supplied 14-conductor ribbon cable. Connect the sensor-specific demo circuit directly to the DC2209 demo board through the 40-pin connector. Connect the DC2026 to the computer using a standard USB cable.
- 4. Launch the QuikEval software. The LTC2983 demonstration software will install and launch automatically.

To launch through QuikEval, repeat steps 3 to 4 above.

To install manually, follow the steps below.

- 1. Download the file "InstallLTC2983.zip" from http://ltspice.linear.com/software/InstallLTC2983.zip.
- 2. Right click the file and choose "Extract All". Choose a suitable location for the extraction folder, and check the "Show extracted files when complete" check box. Click "Extract" to extract the files.
- 3. In the extracted folder, double-click the file ins2983.msi and follow the prompts to install the LTC2983 QuikEval module.
- 4. In the extracted folder, double-click the file CDM20824\_ Setup.exe to install the USB drivers. (Note: If you are sure that you have up-to-date FTDI drivers, you can skip this step.)

To launch manually, from the Start menu, select "Linear Technology"  $\rightarrow$  "LTC2983"  $\rightarrow$  "LTC2983".

Regardless of the installation method, the user can later launch the program manually or, if installed, through QuikEval.

## **QUICK START PROCEDURE**

When the program is started, the screen in Figure 1 appears.

There are menus for Configuration, Evaluation, C code generation, and Help. Moving the mouse pointer over the

toolbar buttons will show a mouseover box describing the button's function.

There is also a log window, which can give useful information (particularly with unexpected events).

Figure 1. Main Screen

2983dsmf

The user can either create a new configuration or load an existing configuration.

#### **Creating a New Configuration**

In this example, the LTC2983 will be configured for a thermocouple on Channel 3 with a RTD PT-100 cold junction on Channel 9, using a sense resistor on Channel 7. When this example is finished, the configuration should look like Figure 2.

Additionally, the type K thermocouple on Channel 3 will use the LTC2983's open circuit checking feature, with an open circuit detect current of 100 $\mu$ A. The RTD PT-100 on Channel 9 will use an American standard. It will also use a 4-wire configuration, without rotation or sharing, and will use 100 $\mu$ A excitation current. The sense resistor for this specific daughter board was measured precisely at 1999.1 $\Omega$ .

To set up this configuration, first add a Type K thermocouple on Channel 3. Click on the Sensor box on Channel 3, and choose the Type K thermocouple, shown in Figure 3.

		Use	Sensor	1	Edit Out (uV, ohm)	Out (deg C)	Status byte

<sup>2</sup> ţ∎-	Ch 9		RTD PT-100	~			

Figure 2. Desired Configuration, After Setup, with a Thermocouple and RTD Cold Junction

After selecting the thermocouple, the demo software will draw a thermocouple on Channel 3, shown in Figure 4. This shows how the thermocouple should be wired to the LTC2983 (for thermocouples, protection resistors and filter capacitors can also be added). There is also a

checkbox under the "Use" column. If it is checked, the demo software will make a measurement on this channel while it is running.

To remove this device, select the "-" choice (top selection in Figure 3).

Figure 3. Selecting the Type K Thermocouple

Figure 4. Display After Thermocouple Is Selected

To configure the thermocouple, click the corresponding "Edit" button to the right on Channel 3. The dialog in Figure 5 will appear. Change the choices to match Figure 5.

In this case, the cold junction sensor is on Channel 9, the thermocouple measurement is single-ended, open-circuit detection is generated by the LTC2983, and the open detect current is  $100\mu$ A.

When satisfied with the changes, click "Accept Changes".

Note that the channel assignment data, shown at the bottom of the window, has updated. This channel assignment is the 32-bit word that is sent into the memory location for the given channel in order to configure it. This is shown in Figure 6.

Close this dialog box.

Figure 6. Configuration Screen After "Accept Changes" Button is Pressed

Next, add a cold junction sensor on Channel 9. Similar to how the thermocouple was selected, go to the Sensor

box on Channel 9, and select the RTD PT-100. The screen should now look like Figure 7.

Figure 9. Main Screen After RTD Configuration Was Changed

#### **Setting Global Parameters**

As mentioned in the LTC2983 data sheet, the temperature unit, rejection frequency and delay between individual conversions are adjustable. To change these parameters, in the menu bar, go to Configuration  $\rightarrow$  Set global parameters. The dialog box in Figure 10 should appear.

The default values are fine here, so close this box.

#### **Checking The Configuration**

To check the configuration, either go to Evaluate  $\rightarrow$  Check configuration in the menu bar, or press the check mark button in the toolbar. The demo software then looks like Figure 11:

LTC2983 parameters	
Temperature unit	Deg C 👻
Rejection frequency	50/60 Hz 🖌
Extra delay between conversions (hundreds of us)	0
OK Cancel

ch 7	-	ок		
Ch8	-			
Ch9 ☑	RTD PT-100			
	[			

Figure 11. Main Screen After Running the Configuration Checker

2983dsmf

The demo software includes an extensive configuration checker, which in this case shows that a sense resistor was never added on Channel 7. To add the sense resistor, select the sense resistor from the Sensor box. Click the edit button and enter the value of the sense resistor (1999.1 in this example). The resulting dialog box should look like Figure 12.

The software rounded 1999.1 to the closest value that can be represented in the LTC2983's 27-bit format.

Close this dialog and check the configuration again – there should be a message that no errors were found.

#### **Save Configuration**

To save this configuration, go to Configuration  $\rightarrow$  Save, or press the save button, and pick a name for the file (demo\_manual1.cfg). The configuration can now be opened from the menu by selecting configuration  $\rightarrow$  open.

The configuration should look as shown in Figure 13.

Every channel with a device is checked, except for the sense resistor. Every sensor that is checked will be measured, but since the sense resistor is part of the RTD measurement and is not measured separately, there is no option to check it.

### Load an Existing Configuration

A number of example configurations, from both the data sheet and from the demo boards, are also available. For example, to load the configuration for the DC2212 demo board, from the menubar select Configuration  $\rightarrow$  Load Example  $\rightarrow$  Demo Board  $\rightarrow$  DC2212\_THERMOCOUPLE\_BOARD. The circuit in Figure 14 will load.

#### Loading The Configuration from a Daughter Board

The demo software has a corresponding configuration for each daughter board. Figure 15 shows such a setup.

The DC2211 Universal Temperature Measurement board is shown at the top right of Figure 15. It includes a sense resistor and a diode. The measured sense resistance was stored on an EEPROM chip when the DC2211 was tested.

Figure 15. Setup with DC2211 Daughter Board

To load the configuration from the daughter board, do the following:

- 1) Plug the setup, which should look similar to what is shown in Figure 15, into a computer.
- 2) In the Configuration menu, select "Load from daughter board".

The software will search for the daughter board, find the appropriate configuration, and load the device values from the EEPROM. The results of loading the DC2211 daughter board are shown in Figure 16.

Click on the Ch 2 Edit button to see the loaded value for the sense resistor.

Refer to the DC2209 demonstration manual for details on interfacing the DC2211 to Thermistors, RTDs, and Thermocouples.

### **RUNNING THE TESTBENCH**

To run the program from the menu bar, go to Evaluate  $\rightarrow$  Run, or press the run button in the toolbar. An example output for a given configuration is shown in Figure 17.

The LTC2983 demo software continuously scans and measures the sensors from top to bottom. The sensor just measured is highlighted. To turn off a sensor, uncheck the corresponding "use" check box.

#### **Seeing Output Errors**

In order to demonstrate the fault reporting capabilities of the LTC2983, the DC2212 thermocouple board is used. Its

configuration automatically loaded using the "Load from Daughter Board" command in the configuration menu. The thermocouple on Channel 1 was removed from the board. The channel with an error is then shown in red, as shown in Figure 18. By hovering the mouse over the status byte, the user can see the corresponding errors, as shown in the figure.

To stop the run, either go to Evaluate  $\rightarrow$  Stop, or press the red "x" button on the toolbar. The program will scan down to the last sensor and then stop.

## **RUNNING THE TESTBENCH**

#### Storing the Output

A file called "output.txt" should be in the main project directory. This file has all the results from the run, including the measured voltages or resistances, temperatures, and status codes. The file is tab-delimited, which means the data can be copied and pasted into Excel. A part of this output is shown in Figure 19.

Figure 19. One Part of the output.txt File (Copied Into Excel)

The LTC2983 can create C code for the configuration in the main screen. This code can be directly loaded into a Linduino (see www.linear.com/linduino) and executed.

To see an example, go to Configuration  $\rightarrow$  Open, navigate to example\_config\_files, and select DC2211\_universal\_

temperature\_measurement\_daughter\_board.cfg. Then, from the menu bar, go to C Code  $\rightarrow$  Create C Code and select an appropriate folder. There should be a message similar to that shown in Figure 20:

Figure 21b. Bottom Part of Generated C Code

Even without a Linduino, one can get a good idea how to program the LTC2983 by examining the generated C code.

C-code for all demonstration boards and each example shown in the data sheet are included in the Linduino sketchbook.

However, the file should be ready to load and run on a Linduino. For further information on how to set up a Lin-

duino, go to www.linear.com/linduino. Once user generated C-code is uploaded into the Linduino, the demonstration software will no longer run. In order to run the demonstration software, the default DC590 code needs to be reloaded into the Linduino board. This is accomplished by opening the Arduino IDE, selecting from the sketchbook Utilities  $\rightarrow$  DC590B, and uploading to the Linduino (see Figure 23).

### **CUSTOM SENSORS**

#### Loading In Custom Coefficients and Tables

The LTC2983 demo software allows custom coefficients for thermocouples, RTDs and thermistors. The basic method is shown below: Create a new configuration on the menu by choosing Configuration  $\rightarrow$  New. Select a custom thermocouple on Channel 3, and click the Edit button on Channel 3. The form in Figure 24 will open.

The thermocouple form now has three new entries: The custom address, the custom length (number of coefficients -1) and the custom values. The custom address is where the user wishes to store the thermocouple table, the length is the length of the data, and the values open a text editor to input the custom values (Figure 25).

The data has comma-separated x, y values. The x unit is mV (for thermocouples) and Ohms (for RTDs and thermistors). The y unit is always kelvin. The x values must be monotonically increasing.

The first table entry for thermocouples is the mV value corresponding to 0 kelvin. The first table entry for RTDs and thermistors is the temperature corresponding to  $0\Omega$  output. This first table entry is used for extrapolation when readings are below the normal range of the sensor. The remaining entries are the valid sensor specific data.

In this example a custom thermocouple is used. The first entry –10mV, 0 kelvin is the point used for extrapolation of data below the first valid data point (100mV, 199 kelvin).

Figure 25. Custom Value Editor

🚺 Ch 7 Custom Thermocouple	Configuratio	on	
	Value	Change to	Accept
tc - cold junction ch	-	-	Changes
tc - differential?	No	No 💌	Cancel
tc - open ckt detect?	No	No	
tc - open ckt detect current	10uA	10uA 💌	
tc - custom address	0	0	
tc - custom length-1	0	0	
tc - custom values	(0 values)		
Channel assignment	0100100000	100000000000000000

## **CUSTOM SENSORS**

The valid data consists of three table entries. Combined with the extrapolation point, four pairs of data are entered into the device. The value for tc – custom length–1 should be 3 in this example (length-1). If the user inputs an incorrect number this results in an error (see Figure 26). Once the correct length is entered and Accept Changes is clicked, the LTC2983 is programmed with the custom table data. A Thermistor Custom Steinhart-Hart table file should look like Figure 27. There are always six Steinhart-Hart coefficients to enter, from A through F.

As was the case before, the LTC2983 can create C code for this configuration, including the custom coefficients. This code can be directly loaded into a Linduino and run.

	Value	Change to	Accept Changes
tc - cold junction ch	-	- •	
tc - differential?	No	No 🕶	Cancel
tc - open ckt detect?	No	No 💌	
tc - open ckt detect current	10uA	10uA 🔽	
tc - custom address	0	0	
tc - custom length-1	0	4	
tc - custom values	(0 values)		
Channel assignment	01001000001	000000000000000000000000000000000000000	-
.c - custom length-1: tc - custoi	m length-1 set to	04, but since the table length is 4,	tc - custom length-1

#### DEMONSTRATION BOARD IMPORTANT NOTICE

Linear Technology Corporation (LTC) provides the enclosed product(s) under the following AS IS conditions:

This demonstration board (DEMO BOARD) kit being sold or provided by Linear Technology is intended for use for **ENGINEERING DEVELOPMENT OR EVALUATION PURPOSES ONLY** and is not provided by LTC for commercial use. As such, the DEMO BOARD herein may not be complete in terms of required design-, marketing-, and/or manufacturing-related protective considerations, including but not limited to product safety measures typically found in finished commercial goods. As a prototype, this product does not fall within the scope of the European Union directive on electromagnetic compatibility and therefore may or may not meet the technical requirements of the directive, or other regulations.

If this evaluation kit does not meet the specifications recited in the DEMO BOARD manual the kit may be returned within 30 days from the date of delivery for a full refund. THE FOREGOING WARRANTY IS THE EXCLUSIVE WARRANTY MADE BY THE SELLER TO BUYER AND IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED, IMPLIED, OR STATUTORY, INCLUDING ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE. EXCEPT TO THE EXTENT OF THIS INDEMNITY, NEITHER PARTY SHALL BE LIABLE TO THE OTHER FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES.

The user assumes all responsibility and liability for proper and safe handling of the goods. Further, the user releases LTC from all claims arising from the handling or use of the goods. Due to the open construction of the product, it is the user's responsibility to take any and all appropriate precautions with regard to electrostatic discharge. Also be aware that the products herein may not be regulatory compliant or agency certified (FCC, UL, CE, etc.).

No License is granted under any patent right or other intellectual property whatsoever. LTC assumes no liability for applications assistance, customer product design, software performance, or infringement of patents or any other intellectual property rights of any kind.

LTC currently services a variety of customers for products around the world, and therefore this transaction is not exclusive.

Please read the DEMO BOARD manual prior to handling the product. Persons handling this product must have electronics training and observe good laboratory practice standards. Common sense is encouraged.

This notice contains important safety information about temperatures and voltages. For further safety concerns, please contact a LTC application engineer.
