

Large Current External FET Controller Type Switching Regulators

Dual-output Step-up, Negative Voltage, Step-down Switching Regulators (Controller type)

BA9743AFV, BA9744FV, BA9741F, BA9741FS

No.13028ECT10

● Description

The BA9743AFV, BA9744FV, and BA9741F/FS are a 2-channel ICs, incorporating a switching regulator controller that uses a pulse width modulation. Both channels can be used for DC/DC converter operations including step up, step down, and inverting. Furthermore, since these ICs have significantly compact design, they are best suited for use as a power supply in miniature portable equipment.

● Features

- 1) Built-in timer-latch type short prevention circuit
- 2) Built-in malfunction prevention circuit during low input voltage
- 3) Built-in high-accuracy reference voltage output pin
 - BA9743AFV 2.505V±1%
 - BA9744FV 1.222V±1%
 - BA9741F/FS 2.5V±4%
- 4) Rest period adjustable over the whole range of duty ratio
- 5) A wide input range provided
 - BA9741F VCC=3.6 to 35V
 - BA9741FS VCC=3.6 to 35V
 - BA9743AFV VCC=3.6 to 35V
 - BA9744FV VCC=2.5 to 35V

● Applications

DC/DC converter in LCD, PC, AV, printer, DVD, projector, TV, Fax machine, Copying machine, Measuring equipment, etc

● Product lineup

	BA9743AFV	BA9744FV	BA9741F/FS
Power supply voltage	3.6V~35V	3.6V~35V	3.6V~35V
Output pin current	100mA	30mA	100mA
Output pin voltage	Max. 35V	Max. 35V	Max. 35V
Error amplifier input voltage	0.3V~1.6V	0.3V~1.5V	0.3V~1.6V
Timing capacitance	100p~15000pF	100p~15000pF	100p~15000pF
Timing resistance	5.1k~50kΩ	3k~15kΩ	5.1k~50kΩ
Oscillation frequency	10k~800kHz	10k~800kHz	10k~800kHz
Operating temperature	-40°C~+85°C	-40°C~+85°C	-40°C~+85°C
Package	SSOP-B16	SSOP-B16	SOP16/SSOP-A16

● Absolute maximum ratings

Item	Symbol	Limits				Unit
		BA9743AFV	BA9744FV	BA9741F	BA9741FS	
Power supply voltage	VCC	36	36	36	36	V
Power dissipation	Pd	450 ^{*3}	450 ^{*3}	500 ^{*1}	650 ^{*2}	mW
Operating temperature	Topr	-40~+85	-40~+85	-40~+85	-40~+85	°C
Storage temperature	Tstg	-55~+125	-55~+125	-55~+125	-55~+125	°C
Output pin current	Io	120 ^{*4}	60 ^{*4}	120 ^{*4}	120 ^{*4}	mA
Output pin voltage	Vo	36	36	36	36	V

*1 Reduce by 4.5 mW/ °C over 25°C.
(when mounted on a PCB of 50mm×50mm×1.6 mm)

*2 Reduce by 5.0 mW/ °C over 25°C.
(when mounted on a PCB of 70mm×70mm×1.6 mm)

*3 Reduce by 6.5 mW/ °C over 25°C.
(when mounted on a PCB of 70mm×70mm×1.6 mm)

*4 Should not exceed Pd- or ASO-value.

Pin assignment

PIN No.	Pin name	Function
1	C T	External timing capacitance
2	R T	External timing resistance
3	N O N 1	Positive input for error amplifier 1
4	I N V 1	Negative input for error amplifier 1
5	F B 1	Output for error amplifier 1
6	D T 1	Output 1 dead time/soft start setting
7	O U T 1	Output 1
8	G N D	GROUND
9	V C C	Power supply
10	O U T 2	Output 2
11	D T 2	Output 2 dead time / soft start setting
12	F B 2	Output for error amplifier 2
13	I N V 2	Negative input for error amplifier 2
14	N O N 2	Positive input for error amplifier 2
15	S C P	Timer latch setting
16	V R E F	Reference voltage output

● Description of operations

1) REFERENE VOLTAGE (Reference voltage section)

From the power supply voltage input through the VCC pin (pin 9), a reference voltage, which is stabilized at the VREF, is supplied as the operating power supply voltage for the internal circuits of the IC and, at the same time, output through the VREF pin (pin 16).

2) ErrAmp1/2 (Error amplifiers)

In the case of step up / step down application, the non-inverting input pins NON1 and NON2 are used to detect the output voltage by feeding back the voltage from the final output stage (i.e., loading side). R1 and R2, which are connected to these pins, are resistors used to control the output voltage. The voltage applied to the inverting input pins INV1 and INV2 as a reference input voltage of the error amplifiers themselves, should be the voltage obtained by dividing the reference voltage (VREF) by resistance.

$$(V_{REF} \frac{R_4}{R_3 + R_4})$$

Furthermore, the resistor Rf and the capacitor Cf, connected between the FB1/2 (Pin 5/12) and INV1/2 (Pin 6/11), are used for feedback of the error amplifier, enabling settings of any desired level of loop gain.

It is recommended to provide AC feedback using the capacitor Cf and the resistor Rf as the feedback for the error amplifier. The amplifier output pins FB1 and FB2 are connected to the PWM and SCP comp., and used as the non-inverting input pins. The output voltage (Vo) setting is shown below:

$$V_o = \frac{R_1 + R_2}{R_2} \times (V_{REF} \frac{R_4}{R_3 + R_4})$$

Since the input range VOM of the NON and INV pins is 0.3V to 1.6V (for BA9741F/FS / BA9743AFV) or 0.3V to 1.5V (for BA9744FV), it is recommended to set the range to approximately VREF/2, i.e., as shown below.

$$\left. \begin{array}{l} V_{REF} \frac{R_4}{R_3 + R_4} \approx 1.25V \text{ (BA9741F/FS/BA9743AFV)} \\ V_{REF} \frac{R_4}{R_3 + R_4} \approx 0.6V \text{ (BA9744FV)} \end{array} \right\}$$

3) Triangle Oscillator (Triangular wave oscillator section)

Used to generate a triangular waveform to be input in the PWM comp. 1/2.

The oscillator circuit charges/discharges the timing capacitor CCT that is connected between the CT pin (pin 1) and the GND at a constant current, set with resistor RRT that is connected between the RT pin (pin 2) and the GND. The triangular waveform is obtained through detecting and resetting this charged/discharged voltage.

The oscillation frequency is given through the external CCT and RRT pins by the formula shown below (BA9741F/FS/BA9743AFV):
(BA9741F/FS/BA9743AFV)

$$f_{osc} = V_{RT}/(2 \cdot C_{CT} \cdot R_{RT} \cdot \Delta V_{osc}) = 1/(C_{CT} \cdot R_{RT})$$

VRT: RT pin voltage 1Vtyp

ΔV_{osc} : Triangular wave amplitude voltage = $V_{t0} - V_{t100} = 0.49V_{typ}$

(BA9744FV)

$$f_{osc} = V_{RT}/(2 \cdot C_{CT} \cdot R_{RT} \cdot \Delta V_{osc}) = 1/(C_{CT} \cdot R_{RT})$$

VRT: RT pin voltage 0.6Vtyp

ΔV_{osc} : Triangular wave amplitude voltage = $V_{t0} - V_{t100} = 0.52V_{typ}$

However, at high frequencies, since delay in the internal circuit results in an error against the formula, set oscillation frequency according to the fosc- RRT graph shown below:

Furthermore, this triangular wave can be output through the CT pin (pin 1).

Range of standard external CCT and RRT pins

RRT: 5.1kΩ at minimum to 50kΩ at maximum (BA9741F/FS / BA9743AFV) or 3kΩ at minimum to 15kΩ at maximum (BA9744FV)

CCT: 100pF at minimum to 15000pF at maximum

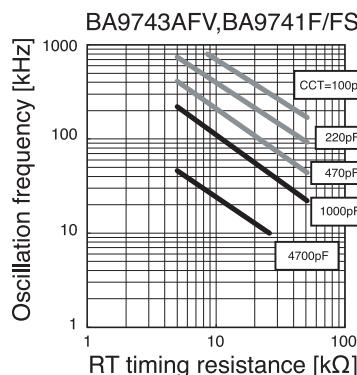

Fig.33

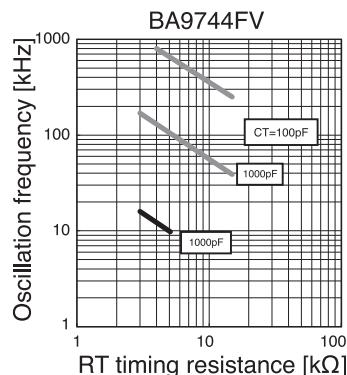

Fig.34

4) SCP Comp (Timer-latch type short-circuit prevention circuit)

When the output voltage malfunctions because of a short circuit, this function is used to turn OFF the output transistor forcedly, in order to protect the system. If the output voltage drops in relation to the set voltage level, an error will be amplified through the Err Amp and the voltage at the FB1/FB2 pins will reach the low voltage side. If SCP Comp sets the voltage below the threshold level for either the FB1 or FB2, (i.e., 1.05Vtyp for the BA9741F/FS / BA9743AFV or 0.25Vtyp for the BA9744FV), the short prevention circuit will be activated to start the charging of the capacitor of SCP pin. When VIT=1.64Vtyp for the BA9741F/FS / BA9743AFV or VIT=1.18Vtyp for the BA9744FV is achieved, the output transistor will turn OFF.

The time is set by the capacitor (Cscp) connected to the SCP (pin 15).

The time TSCP is obtained by the formula shown below:

$$SCPT = \frac{VIT + VSTB}{ISCP} \cdot Cscp$$

For example, in the case of the BA9743AFV, assuming that Cscp=0.1μF, VIT=1.64V, VSTB=0.05V and ISCP=2.5μA.

$$SCPT = \frac{1.64 - 0.05}{2.5\mu} \times 0.1\mu = 63.6mS$$

In order to stop the function of the short prevention circuit, short-circuit the SCP pin to GND

5) PWM Comp 1/2 DEAD TIME (Rest period adjustment circuit / Dead time)

This function can be set by dividing the resistance of DT1 and DT2 pins (pins 6 and 11) between VREF and GND. With PWM Comp, comparing the dead time voltage input and the error voltage from the Err Amp with the triangular wave, the output drive transistors are turned ON/OFF.

When Dead time voltage>Error voltage, the output duty is determined by the dead time voltage.

The dead time voltage VDT is obtained by the expression shown below

$$VD = VREF \cdot \frac{R2}{R1 + R2}$$

(BA9741F/FS/BA9743AFV)

When VDT=1.48Vtyp: Duty 100%

When VDT=1.97Vtyp: Duty 0%

(Provided, however that fosc=10kHz)

(BA9744FV)

When VDT=0.49Vtyp: Duty 100%

When VDT=1.01Vtyp: Duty 0%

(Provided, however that fosc=10kHz)

Note: If the oscillation frequency is at a high level, the upper/lower limits (Vt0/Vt100) of the triangular wave will be shifted in the direction in which the amplitude is developed.

6) PWM Comp 1/2 SS (Soft start function)

By connecting the resistors R1 and R2, and the capacitor CDT to DT pins (pins 6 and 11), as shown in figure on the right, the soft start function is enabled.

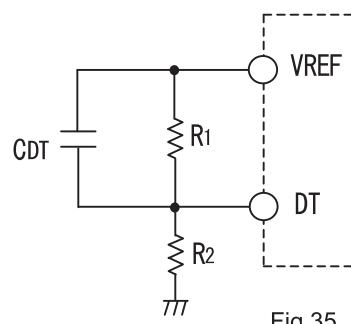

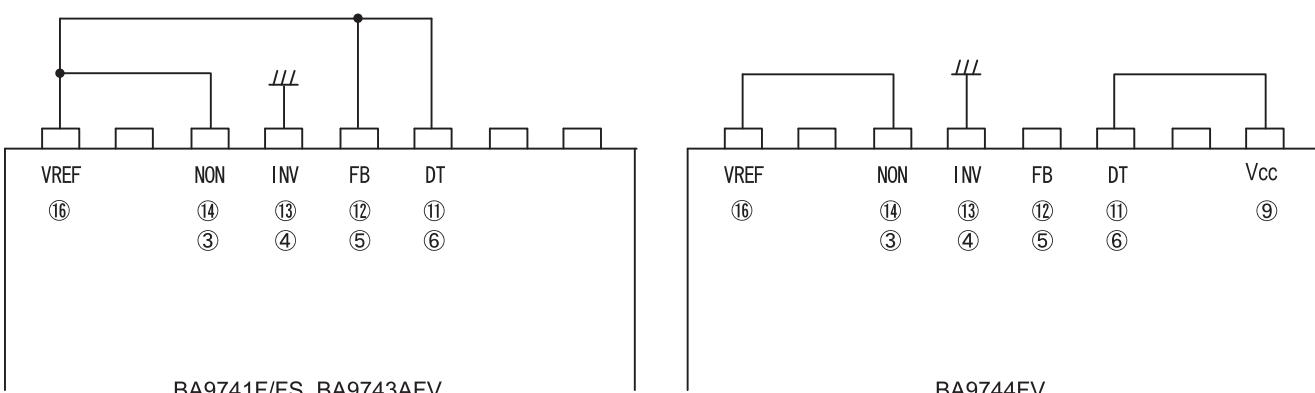

Fig.35

7) Handling of pins of unused channel

BA9741F/FS, BA9743AFV

Fig.36

BA9744FV

Fig.37

If channel 1 is only used, the unused channel should be handled as shown above.

● Typical application circuit

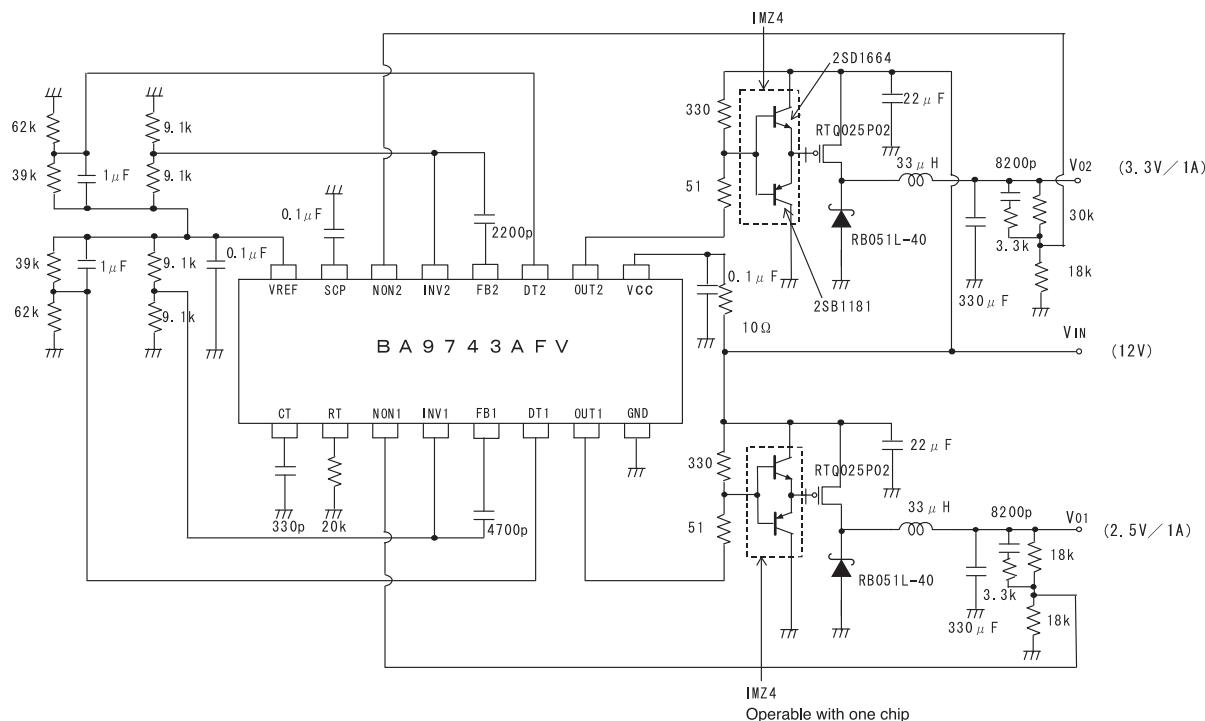

Fig. 38

1) Setting the coil (L) and capacitor (Co) of output section

The settings of the coil and capacitor with the step down application are made as shown below::.

<Setting of L value>

If the load current increases, a current will continuously flow through the coil, thus holding the relational formulas (1).

$$L = \frac{T_s}{\Delta I_L} \times \frac{(V_{IN} - V_o) \times V_o}{V_{IN}} \quad (1)$$

V_{IN} : Input voltage

T_s : 1/(Oscillation frequency)

ΔI_L : Ripple current of coil

ΔI_L should typically be set to 30% or less than the maximum output current (I_{omax}).

Increasing the L value decreases the ripple current (ΔI_L). Generally, the larger the L value, the smaller the allowable current of coil. Consequently, since the ripper current exceeding the allowable current results in variations in the L value, check for the appropriate current value with the coil manufacturer.

<Setting of output capacitor Co>

The output capacitor Co should be selected according to the ESR (Electric Series Resistance) characteristics of the capacitor.

For the output ripple voltage (ΔV_o), the following formula is held according to the ESR of the output capacitor:

$$\Delta V_o = \Delta I_L \times ESR$$

ESR: Series resistance of the output capacitor Co

A ripple component, due to the output capacitor, is significantly small in comparison to that due to the ESR.

Even though the Co value should meet the condition of $1/(3 \cdot T_s) > 1/2\pi (L \times C_o)^{1/2}$, it is recommended to use a capacitor with a high enough capacitance value, to meet the ESR condition.

<Switching element>

The switching element should be determined according to the peak current. The peak current I_{sw} (peak) flowing thought the switching element is equal to that flowing through the coil, thus holding the formula shown below:

$$I_{sw} (\text{peak}) = I_o + \Delta I_L / 2$$

Select a switching element that has an allowable current that is twice (or more) as large as the peak current obtained by the formula shown above. Furthermore, with consideration given to overcurrent caused by output short-circuited, provide an application for overcurrent protection, wherever necessary.

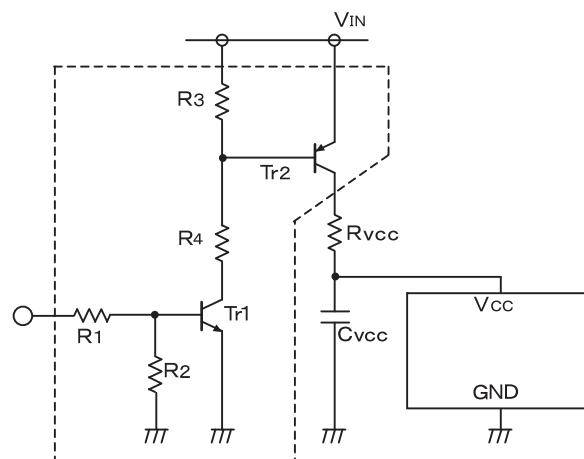

2) Typical standby circuit

The typical standby circuit is shown in the dotted frame below.

An additional switch is typically mounted between the power supply (VIN) and the IC power supply pin (Vcc).

Controlling the switch so that Tr1 and Tr2 will turn OFF when the standby circuit is activated, reduces current flow in standby mode.

It is recommended to set the R_{VCC} to 10Ω and the C_{VCC} to 0.1μF.
Set R_{VCC} and the C_{VCC} within the range of 1 to 100Ω and 0.1 to 100μF.
Providing additional R_{VCC} and C_{VCC} helps to cut noises from the VIN line.

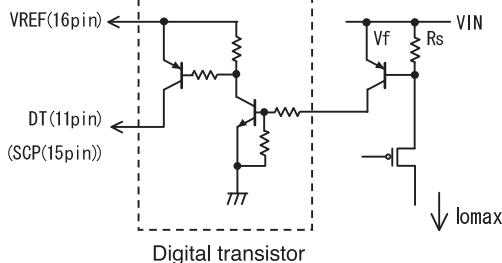

3) Typical overcurrent protection circuit

Insert sensing resistors between FET source and VIN of the channel P of output section, as shown in figure on the right, to detect an overcurrent.

$$I_{OMAX} = \frac{V_f}{R_S}$$

If any sensing resistor detects an overcurrent, the composite digital transistor, shown in figure on the right, will turn ON to set the DT pin to "H", thus turning OFF the output.

Once the DT pin has been set to "H", soft start (restart) mode is enabled through an external capacitor. Furthermore, if an overcurrent flows through the circuit, latching will be enabled through connecting the digital transistor PNP collector to the SCP pin (pin 15).

Typical overcurrent protection circuit Fig.40

4) Typical application of Master/Slave operation circuit

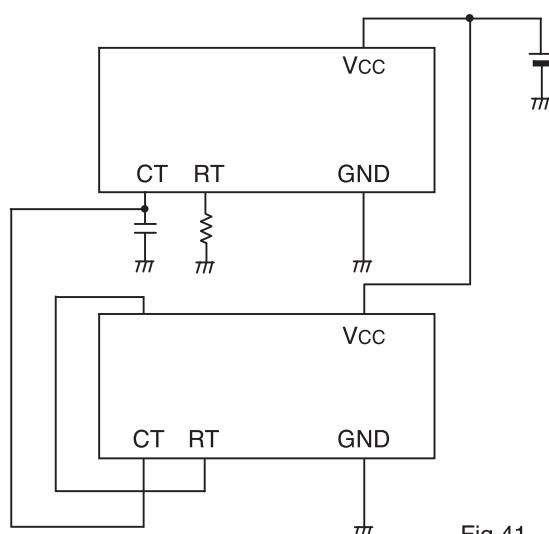

Fig.41

Caution:

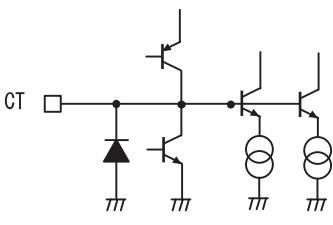

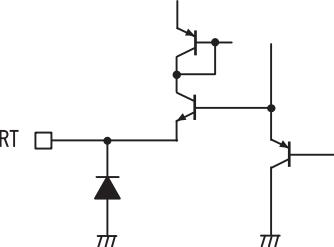

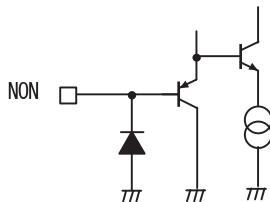

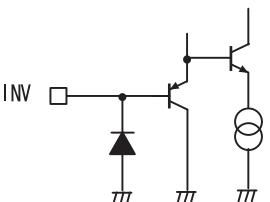

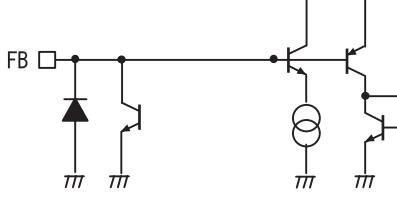

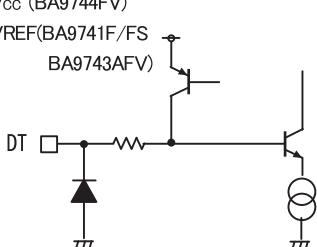

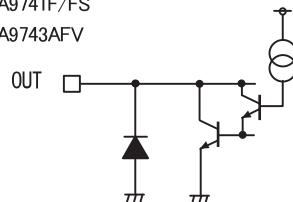

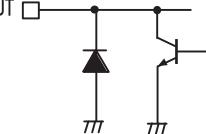

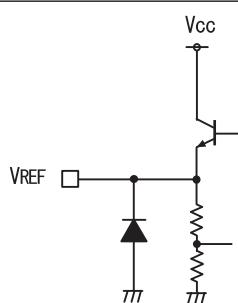

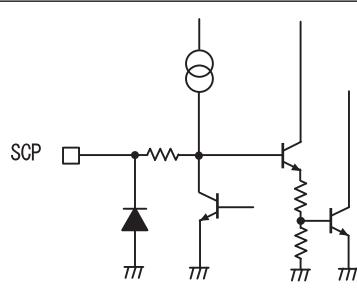

The oscillation frequency should be determined according to capacitors and resistors connected to the CT pin (pin 1) and RT pin (pin 2) on the master IC.

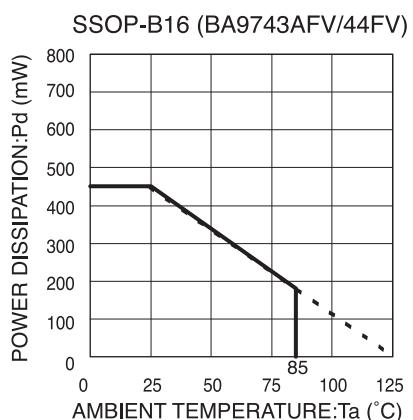

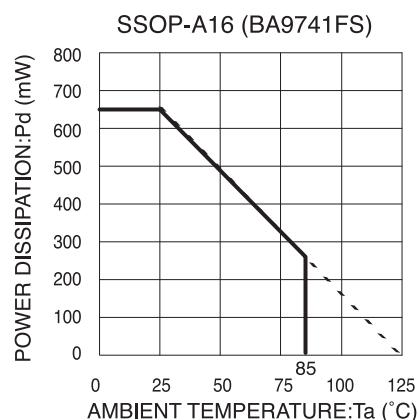

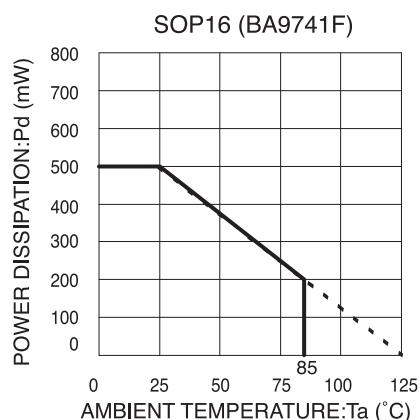

However, increasing the number of slave ICs, increases the parasitic capacitance of these ICs in contact with the CT pin, resulting in a drift of oscillation frequency.

● Equivalent circuit

Notes

- 1) The information contained herein is subject to change without notice.
- 2) Before you use our Products, please contact our sales representative and verify the latest specifications :
- 3) Although ROHM is continuously working to improve product reliability and quality, semiconductors can break down and malfunction due to various factors. Therefore, in order to prevent personal injury or fire arising from failure, please take safety measures such as complying with the derating characteristics, implementing redundant and fire prevention designs, and utilizing backups and fail-safe procedures. ROHM shall have no responsibility for any damages arising out of the use of our Products beyond the rating specified by ROHM.
- 4) Examples of application circuits, circuit constants and any other information contained herein are provided only to illustrate the standard usage and operations of the Products. The peripheral conditions must be taken into account when designing circuits for mass production.
- 5) The technical information specified herein is intended only to show the typical functions of and examples of application circuits for the Products. ROHM does not grant you, explicitly or implicitly, any license to use or exercise intellectual property or other rights held by ROHM or any other parties. ROHM shall have no responsibility whatsoever for any dispute arising out of the use of such technical information.
- 6) The Products are intended for use in general electronic equipment (i.e. AV/OA devices, communication, consumer systems, gaming/entertainment sets) as well as the applications indicated in this document.
- 7) The Products specified in this document are not designed to be radiation tolerant.
- 8) For use of our Products in applications requiring a high degree of reliability (as exemplified below), please contact and consult with a ROHM representative : transportation equipment (i.e. cars, ships, trains), primary communication equipment, traffic lights, fire/crime prevention, safety equipment, medical systems, servers, solar cells, and power transmission systems.
- 9) Do not use our Products in applications requiring extremely high reliability, such as aerospace equipment, nuclear power control systems, and submarine repeaters.
- 10) ROHM shall have no responsibility for any damages or injury arising from non-compliance with the recommended usage conditions and specifications contained herein.
- 11) ROHM has used reasonable care to ensure the accuracy of the information contained in this document. However, ROHM does not warrant that such information is error-free, and ROHM shall have no responsibility for any damages arising from any inaccuracy or misprint of such information.
- 12) Please use the Products in accordance with any applicable environmental laws and regulations, such as the RoHS Directive. For more details, including RoHS compatibility, please contact a ROHM sales office. ROHM shall have no responsibility for any damages or losses resulting from non-compliance with any applicable laws or regulations.
- 13) When providing our Products and technologies contained in this document to other countries, you must abide by the procedures and provisions stipulated in all applicable export laws and regulations, including without limitation the US Export Administration Regulations and the Foreign Exchange and Foreign Trade Act.
- 14) This document, in part or in whole, may not be reprinted or reproduced without prior consent of ROHM.

Thank you for your accessing to ROHM product informations.
