### DESCRIPTION:

The IDT5V9351 is a high performance, zero delay, low skew, phase-lock loop (PLL) clock driver. It has four banks of configurable outputs. The IDT5V9351 uses a differential PECL reference input and an external feedback input. These features allow the IDT5V9351 to be used as a zero delay, low skew fan-out buffer. REF\_SEL allows selection between PECL input or TCLK, a CMOS clock driver input.

If PLL\_EN is set to low and REF\_SEL to high, it will bypass the PLL. By doing so, the IDT5V9351 will be in clock buffer mode. Any clock applied to TCLK will be divided down to four output banks.

When PLL\_EN is set high, PLL is enabled. Any clock applied to TCLK will be clocked in both phase and frequency to FBIN. PECL clock is activated by setting REF\_SEL to low.
